LIST OF ABBREVIATED TERMS

A	absorption factor from inhalation
ACES	Advanced Collaborative Emissions Study
ASF	age sensitivity factor
ASTs	Aboveground storage tanks
AB	Assembly Bill
APN	Assessor's Parcel Number
AT	averaging time
ATCM	Airborne Toxic Control Measure
CARB	California Air Resources Board
CCAA	California Clean Air Act
CEQA	California Environmental Quality Act
COPC	Contaminant of Potential Concern
CPF	cancer potency factor
C_{air}	air concentration from model
C_i	air concentration of substance
DBR	daily breathing rate
DCA	1,2-Dichloroethane
DOORS	Diesel Off-Road Reporting System
DPM	Diesel Particulate Matter
DRRP	Diesel Risk Reduction Plan
Dose-air	dose through inhalation
EMFAC	Emission Factors Model
ED	exposure duration
EF	exposure frequency
°F	degrees Fahrenheit
FCAA	Federal Clean Air Act
FAH	fraction of time spent at home
GVWR	gross vehicle weight rating
HAP	hazardous air pollutant
HRA	health risk assessment
kg	kilogram
L	liter
MATES	Multiple Air Toxics Exposure Study
MEIR	Maximally Exposed Individual Receptor
mg	milligrams
$\mu g/m^3$	micrograms per cubic meter
MSAT	Mobile Source Air Toxic
NAAQS	National Ambient Air Quality Standards
NED	National Elevation Dataset
NESHAP	National Emissions Standards for Hazardous Air Pollutants
NO_2	nitrogen dioxide
NO_X	nitrogen oxides

LIST OF ABBREVIATED TERMS (CONTINUED)

O_3	ozone
OEHHA	Office of Environmental Health Hazard Assessment
PAH	polycyclic aromatic hydrocarbon
PCBs	polychlorinated biphenyls
PCE	tetrachloroethene
PM	particulate matter
PM_{10}	particulate matter less than 10 microns in diameter
$PM_{2.5}$	particulate matter less than 2.5 microns in diameter
PERP	Portable Equipment Registration Program
REL	Reference Exposure Level
REL_i	Reference Exposure Level of substance
$Risk_{inh\text{-}res}$	residential inhalation cancer risk
SB	Senate Bill
SVOC	semi-volatile organic compounds
TAC	Toxic Air Contaminant
TCE	trichloroethene
TPH	petroleum hydrocarbons
U.S. EPA	United States Environmental Protection Agency
VOC	volatile organic compound

1.0 INTRODUCTION

The purpose of this Health Risk Assessment (HRA) is to evaluate potential health risks associated with offsite exposure to Toxic Air Contaminants (TAC) including Diesel Particulate Matter (DPM) and impacted soils resulting from the implementation of the proposed 7825 San Leandro Street Project (Project). This HRA was prepared in accordance with the requirements of the Bay Area Air Quality Management District (Bay Area Air District) and guidance from the Office of Environmental Health Hazard Assessment (OEHHA) to determine if health risks are likely to occur as a result of Project activities. Technical data are included as Appendix A: Modeling Data.

1.1 Project Location

The Project site comprises approximately 14.9-acres located at 7825 San Leandro Street, in the City of Oakland, California; refer to Exhibit 1: Regional Vicinity and Exhibit 2: Site Vicinity. The Project site consists of 14 parcels (Assessor Parcel Numbers [APNs]: 041 417500302, 041 417501800, 041 417501600, 041 417501000, 041 417500600, 041 417500500, 041 417501700, 041 417501900, 041 42000102, 041 420900700, 041 420900101, 041 420900302, 041 420800100, and 041 420900801). The Project site is bound by Hegenberger Road to the north, San Leandro Street to the east, existing commercial uses and the Elmhurst Creek canal to the south, and train tracks to the west. The Project site is zoned as General Industrial (IG) and Commercial Industrial Mix-2 (CIX-2) districts with General Plan land use designations of Business Mix and General Industry and Transportation.

1.2 Project Description

The Project proposes to construction an approximately 311,000 square foot (sf) industrial building. The Applicant proposes a speculative warehouse at this time, as the future tenant and nature of the ultimate use are currently unknown. The main building entrance and employee amenity space would be located at the northern end of the building. The new facility would include up to 20,000 square feet of accessory office space with an additional 5,000 square feet of accessory office space would be provided at a mezzanine level; refer to Exhibit 3: Site Plan.

Automobile access would be provided via three driveways on the east side of the Project site from San Leandro Street. Trucks would access the site utilizing the southern driveways along San Leandro Street. Passenger vehicles would access the site through the northern driveway along San Leandro Street intersecting with 77th Avenue. Passenger vehicles would use this driveway to access the north employee parking area via the internal drive aisles along the western, southern, and eastern boundaries of the proposed warehouse building.

Hours of Operation

The tenant(s) of the warehouse facility has not been identified; therefore, the precise nature of facility operations cannot be determined at this time. Any future occupant would be required to adhere to the pertinent County regulations. For the purposes of this analysis, the hours of operation are assumed to be 7 days a week, 24 hours per day.

Construction Activities

Project construction is anticipated to being in April 2027 with a duration of approximately 22 months. Construction of the Project would require approximately 646,343 square feet of hardscape demolition. Earthwork activities would result in approximately 2,100 cubic yards (cy) of soil remediation export and 18,806 cy of import. In addition to site development, the Project would include on-site infrastructure improvements to remove and replace the existing sewer and stormwater pipelines. Construction of the Project would require the following phases: demolition, site preparation, grading, infrastructure improvements, building construction, paving, and architectural coatings.

1.3 Site Background

The Project site consists of the former AB&I Foundry and was previously developed with a two-story office building, multiple warehouses, a foundry and manufacturing building, a material storage area, and a parking lot. Currently, the Project site is covered with concrete and asphalt/concrete pavement with a small portion of soil along the southwestern edge of the Site.[1]

The former owner and operator (AB&I) operated a foundry at the Project site from at least 1940 until October 2022. During foundry operations, the Site was utilized for the manufacture of metal pipe and pipe fittings. Operations at the Site included the production of cast iron for the manufacturing of fittings and pipe from recycled scrap iron, pig iron, and steel, which it accepted and stockpiled on-Site. Major operations involved scrap metal melting, mold making, fitting and pipe casting, and final finishing and coating of pipes and fittings. AB&I ceased foundry operations in October 2022 and vacated the Project site in April 2023.[2]

The Project site has three site assessment records associated with the former industrial use (State Water Resources Control Board, 2024a). Two records have been closed (Case # SL18298719 and Case # RO0000092) while one record for a site cleanup program requirement case is still open and currently investigating non potable water contamination (Case # RO0003535). The open site assessment has been ongoing as of May 2022. [3]

Previous Environmental Studies

Environmental investigations and cleanup activities have been ongoing at the former AB&I Foundry site. One closed cleanup program site (Case #SL18298719) addressed contaminants such as arsenic, chromium, copper, and lead, which was formally closed in 2011 after a No Further Action letter was issued by the County. In addition, a closed leaking underground storage tank (LUST) case (Case #RO0000092) was associated with seven LUSTs on-site; this case was closed in November 2011 after all monitoring wells were properly decommissioned.[4]

In preparation for redevelopment, Duke Realty conducted a Phase I Environmental Site Assessment (ESA) in April 2022, followed by a limited Phase II investigation in May 2022. Soil, groundwater, and

soil vapor samples identified exceedances of environmental screening levels (ESLs) for benzene in shallow soils and vinyl chloride in groundwater. A subsequent Demolition Memorandum was issued in April 2023, and Alameda County Department of Environmental Health (ACDEH) approved a Work Plan requiring further soil sampling, soil vapor probe installation, and quarterly groundwater monitoring.[5][6]

On behalf of Prologis, Roux Associates conducted additional investigations in 2024 including installation of 64 passive soil gas samplers, eight groundwater monitoring wells, and collection of 30 soil samples. Laboratory testing, as summarized in the *Passive Soil Gas and Groundwater Investigation Report* (October 2024), found exceedances of applicable thresholds in soil vapor, and no exceedances in water. Recommendations include continued active soil gas sampling, evaluation of bioattenuation, additional soil investigations focused on hot spots and areas of future disturbance, and continued quarterly groundwater sampling even though monitoring indicated no additional investigation of ground water was warranted.[7]

Roux Associates also prepared a Data Gap Investigation Report in October 2024 to refine the Site Conceptual Model. This study further delineated VOCs assessed benzene in soil vapor and evaluated vapor intrusion risk. Findings indicated that the nearly complete redevelopment of the site with buildings and paved surfaces would eliminate direct soil contact. However, elevated soil vapor concentrations warranted the development of a Vapor Intrusion Conceptual Site Model in accordance with ACDEH guidance. Metals in soil were also found to exceed screening levels, although exceedances were sporadic and generally minor, with the exception of lead. Based on the results of these investigations and agency oversight, the site was determined to be suitable for industrial development.[8]

Project Remediation and Development

Between the closure of the former AB&I Foundry and the preparation of this analysis, the Project applicant, Prologis, has completed the above ground demolition of buildings and structures. However, hardscape demolition and environmental remediation will be required and is included within the site preparation and grading phases of the Project.

Due to past land uses and impacts encountered on the Project site, demolition activities may disturb soil, soil gas, and potentially groundwater containing contaminants, resulting in potential exposure of offsite populations to toxic air contaminants (TACs). Accordingly, this analysis evaluates TAC impacts associated with the disturbance of impacted soil during construction. In addition, scoping comment letters were received expressing concerns regarding potential TAC exposures during construction. Therefore, this analysis conservatively evaluates potential health risks associated with the short-term construction impacts associated with the impacted soil, over a lifetime exposure scenario, consistent with California Office of Environmental Health Hazard Assessment's (OEHHA) health-protective risk assessment methodology.

As discussed in the *7825 San Leandro Street Project Draft Environmental Impact Report (EIR)*, the Project would also be subject to several Standard Conditions of Approval (SCA) related to impacted soils. SCA HAZ-1, Hazardous Materials Related to Construction, requires the implementation of Best Management Practices (BMPs) during construction to prevent adverse impacts on groundwater, soils, and human health, including proper handling of chemicals and fuels, compliance with lead-safe practices, and immediate regulatory notification and response if impacted materials are encountered. SCA-2, Hazardous Building Materials and Site Contamination, requires the applicant to assess, manage, and remediate hazardous materials, soil, and groundwater under City-approved plans prepared by qualified professionals and in compliance with all applicable regulations. SCA-3, Environmental Site Assessment Required, requires the applicant to prepare and implement a City-approved Hazardous Materials Business Plan to ensure proper handling, employee training, and emergency response. The Project would also be required to implement Project Design Features (PDF) HRA-1.

Project Design Features

PDF HRA-1: Prior to issuance of grading and/or building permits (whichever occurs earliest), the Project applicant shall prepare and submit a Soil and Stockpile Management Plan (SSMP) to the Director of Planning, Building, and Code Enforcement, or the Director's designee. The plan shall detail best management practices (BMPs) for handling, stockpiling, covering, and transporting impacted soils during construction. The SSMP shall also be accompanied by a letter signed by a qualified air quality or environmental professional verifying that the proposed measures are consistent with Bay Area Air District requirements and the standards set forth below:

- **Stockpile Covering and Stabilization**
  - Stockpiles of impacted soil shall be covered with plastic sheeting or geotextile fabric at all times when not actively being worked.
  - Covers shall be anchored to prevent wind displacement.
  - For stockpiles left in place for more than 14 days, additional stabilization measures (e.g., tackifier or temporary vegetation) shall be applied.
  - In accordance with Bay Area Air District Regulation 8, Rule 40, soils containing volatile organic compounds (VOCs) in excess of 50 ppm by weight shall be segregated from clean soils, kept visibly moist or continuously covered, and either treated, backfilled, or removed from the site within applicable regulatory timelines.
- **Dust Suppression and Airborne TAC Control**
  - Apply water spray or misting during excavation, loading, and stockpiling to suppress fugitive dust emissions.
  - Water application shall be controlled to prevent excess runoff.
  - All disturbed areas shall be kept visibly moist, and visible dust beyond the property boundary is prohibited in accordance with Bay Area Air District Regulation 6, Rule 1.
- **Perimeter and Stormwater Controls**
  - Stockpiles shall be located at least 50 feet from storm drain inlets, drainage channels, and sensitive receptors where feasible.

  - Install silt fences, fiber rolls, or berms around stockpiles to prevent migration of soil or runoff.
  - Storm drain inlets adjacent to soil handling areas shall be protected with gravel bags, filter fabric, or equivalent BMPs.
- **Handling of Contaminated Soils**
  - Impacted soils identified with metals, VOCs, PAHs, or other contaminants above regulatory screening levels shall be segregated from clean soils.
  - Contaminated soils shall be transported in covered trucks to appropriate permitted disposal or treatment facilities.
  - Decontamination water, protective equipment, or other waste generated from soil handling shall be collected and managed in accordance with applicable hazardous waste requirements.
- **Equipment and Vehicle Controls**
  - All haul trucks transporting soils shall be covered with tarps and maintain at least 6 inches of freeboard.
  - Vehicle speeds on unpaved surfaces shall be limited to 15 mph.
  - Idling of diesel-powered construction equipment shall be minimized in accordance with CARB's Airborne Toxic Control Measure.
- **Inspections and Monitoring**
  - Stockpiles, covers, and BMPs shall be inspected daily during active construction.
  - Any torn covers, ineffective water suppression, or failing sediment barriers shall be repaired immediately.
  - If visible dust emissions or odors are observed, work shall be suspended until corrective measures are implemented.

1. HEAVY BROOM FINISH CONCRETE PAVEMENT.
2. ASPHALT CONCRETE (AC) PAVING
3. ACCESSIBLE PATH OF TRAVEL
4. DRIVEWAY APRONS
5. 5'-6"X5'-6"X4" THICK CONCRETE EXTERIOR LANDING PAD TYP. AT ALL EXTERIOR MAN DOORS TO LANDSCAPED AREAS. FINISH TO BE MEDIUM BROOM FINISH SLOPE TO BE 1/4" : 12" MAX.
6. APPROXIMATE LOCATION OF TRANSFORMER.
7A. 6' HIGH BLACK METAL TUBULAR STEEL SECURITY FENCE.
7B. 6' HIGH BLACK METAL TUBULAR STEEL SECURITY GATE.
8. CONCRETE WALKWAY, MEDIUM BROOM FINISH. SEE "L" DRAWINGS.
9. CONCRETE RAMP WITH CONCRETE GUARD WALL. SEE "C" DRAWINGS.
10. SHORT TERM BIKE RACK.
11. FUTURE ELECTRIC VEHICLE CHARGER.
12. EXTERIOR METAL STEEL STAIR.
13. 12' x 14' DRIVE-IN DOOR
14. LANDSCAPE.
15. CONC. FILLED GUARD POST 6" DIA. U.N.O. 48" H.
16. PRE-CAST CONC. WHEEL STOP.
17. TRUNCATED DOMES.
18. ACCESSIBLE PARKING STALL SIGN.
19. HARDSCAPE AT ENTRANCE.
20. ACCESSIBLE ENTRY SIGN.
21. PUMP ROOM.
22. NOT USED
23. ELECTRICAL ROOM.
24. CONCRETE DOLLY PAD. SEE SITE PLAN FOR WIDTH AND "C" DRAWINGS.
25. LONG TERM BIKE RACK.
26. NOT USED.
27. EXTERIOR PARKING LIGHT POLE.

SITE PLAN GENERAL NOTES

1. THE SITE PLAN BASED ON THE SOILS REPORT PREPARED BY GEOTECHNICAL ENGINEER, DATE, PROJECT NUMBER #
2. IF SOILS ARE EXPANSIVE IN NATURE, USE STEEL REINFORCING FOR ALL SITE CONCRETE
3. ALL DIMENSIONS ARE TO THE FACE OF CONCRETE WALL, FACE OF CONCRETE CURB OR GRID LINE U.N.O.
4. SEE "C" PLANS FOR ALL CONCRETE CURBS, GUTTERS AND SWALES
5. PROVIDE STRUCTURAL CALCULATION AND CONSTRUCTION ANCHORAGE DETAIL FOR TRANSFORMER PRIOR TO INSTALLATION.
6. SEE "C" DRAWINGS FOR POINT OF CONNECTIONS TO OFF-SITE UTILITIES. CONTRACTOR SHALL VERIFY ACTUAL UTILITY LOCATIONS.
7. PROVIDE POSITIVE DRAINAGE AWAY FROM BLDG. SEE "C" DRAWINGS.
8. CONTRACTOR TO REFER TO "C" DRAWINGS FOR ALL HORIZONTAL CONTROL DIMENSIONS. SITE PLANS ARE FOR GUIDANCE AND STARTING LAYOUT POINTS.
9. SEE "C"DRAWINGS FOR FINISH GRADE ELEVATIONS.
10. CONCRETE SIDEWALKS TO BE A MINIMUM OF 4" THICK W/ TOOLED JOINTS AT 6' O.C. EXPANSION/CONSTRUCTION JOINTS SHALL BE A MAXIMUM 12' EA. WAY W/ 1:20 MAX. SLOPE. EXPANSION JOINTS TO HAVE COMPRESSIVE EXPANSION FILLER MATERIAL OF 1/4". FINISH TO BE A MEDIUM BROOM FINISH
11. U.N.O. PROVIDE KNOX BOXES AT ALL OFFICE ENTRANCES.
12. PAINT CURBS AND PROVIDE SIGNS TO INFORM OF FIRE LANES AS REQUIRED BY FIRE DEPARTMENT.
13. ON-SITE FIRE MAIN, FIRE SPRINKLER, AND SPRINKLER MONITORING SYSTEM SHALL BE SUBMITTED SEPARATELY TO THE FIRE DEPARTMENT FOR REVIEW AND PERMITTING.
14. ALL VERTICAL MOUNTING POLES OF FENCING SHALL BE CAPPED.
15. LANDSCAPED AREAS SHALL BE DELINEATED WITH A MINIMUM SIX INCHES (6") HIGH CURB
16. ALL INTERIOR AND EXTERIOR WALK SURFACES TO BE NON-SLIP TYPE

SITE PLAN GENERAL LEGEND

- CONCRETE PAVING. SEE "C" DRWGS. FOR THICKNESS
- STANDARD PARKING STALL (8'-6" X 18')
- CLEAN AIR/VANPOOL/EV WITH CHARGER
- CLEAN AIR/ VANPOOL/EV WITH CONDUIT STUB FOR FUTURE EV WITHOUT CHARGER
- TRAILER PARKING (10' X 53')
- NUMBER OF PARKING STALLS
- LANDSCAPED AREA
- ACCESSIBLE PARKING STALL (9' X 18') ACCESSIBLE AISLE
- ACCESSIBLE PARKING (VAN) STALL (12' X 18') + 5' W/ ACCESSIBLE AISLE
- PATH OF TRAVEL. MINIMUM WIDTH TO BE 4'. SLOPE NOT TO EXCEED 5% IN THE DIRECTION OF TRAVEL AND CROSS SLOPE NOT TO EXCEED 2%. SEE CIVIL FOR GRADING PLAN
- POTENTIAL OFFICE

2.0 ENVIRONMENTAL SETTING

2.1 Climate

The Project is within the San Francisco Bay Area Air Basin (SFBAAB), which comprises all of Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, and Santa Clara counties, the southern portion of Sonoma, and the southwestern portion of Solano County. SFBAAB is characterized by complex terrain, consisting of coastal mountain ranges, inland valleys, and bays, which distort wind flow patterns. The Coast Range splits resulting in a western coast gap, Golden Gate, and an eastern coast gap, Carquinez Strait, which allow air to flow in and out of the SFBAAB and the Central Valley.

The climate is dominated by the strength and location of a semi-permanent, subtropical high-pressure cell. During the summer, the Pacific high-pressure cell is centered over the northeastern Pacific Ocean resulting in stable meteorological conditions and a steady northwesterly wind flow. Upwelling of cold ocean water from below to the surface because of the northwesterly flow produces a band of cold water off the California coast. The cool and moisture-laden air approaching the coast from the Pacific Ocean is further cooled by the presence of the cold-water band resulting in condensation and the presence of fog and stratus clouds along the Northern California coast.

In the winter, the Pacific high-pressure cell weakens and shifts southward resulting in wind flow offshore, the absence of upwelling, and the occurrence of storms. Weak inversions coupled with moderate winds result in low air pollution potential.

2.2 Toxic Air Contaminants

TACs are airborne substances capable of causing short-term (acute) and long-term (chronic or carcinogenic, i.e., cancer causing) adverse human health effects (i.e., injury or illness). TACs include both organic and inorganic chemical substances. They may be emitted from a variety of common sources including gasoline stations, automobiles, dry cleaners, industrial operations, and painting operations. The current California list of TACs includes approximately 200 compounds, including particulate emissions from diesel-fueled engines.

Hazardous Air Pollutants (HAP) is a term used by the Federal Clean Air Act (FCAA) that includes a variety of pollutants generated or emitted by industrial production activities. Identified as TACs under the California Clean Air Act (CCAA), ten have been singled out through ambient air quality data as being the most substantial health risk in California. Direct exposure to these pollutants has been shown to cause cancer, birth defects, damage to the brain and nervous system, and respiratory disorders. The California Air Resources Board (CARB) provides emission inventories for only the larger air basins, including the SFBAAB.

Industrial facilities and mobile sources are significant sources of TACs. The electronics industry, including semiconductor manufacturing, has the potential to contaminate both air and water due to the highly toxic chlorinated solvents commonly used in semiconductor production processes. In addition to industrial sources, various common urban facilities also produce TAC emissions, such as gasoline stations (benzene), hospitals (ethylene oxide), and dry cleaners (perchloroethylene). Automobile exhaust also contains TACs such as benzene and 1,3-butadiene. DPM was identified as a TAC by CARB in 1998. DPM differs from other TACs in that it is not a single substance but rather a complex mixture of hundreds of substances. Bay Area Air District research indicates that mobile-

source emissions of DPM, benzene, and 1,3-butadiene represent a substantial portion of the ambient background risk from TACs in the SFBAAB. Additionally, given the Project site's long industrial history as a foundry, multiple classes of contaminants of potential concern (COPCs) have been identified in soil, groundwater, and soil vapor, including metals (arsenic, lead, nickel), VOCs such as benzene and trichloroethene (TCE), semi-volatile organic compounds (SVOCs), petroleum hydrocarbons (TPH), and polychlorinated biphenyls (PCBs). Many of these substances are designated TACs under the CCAA and/or HAPs under the FCAA.

Toxic contaminants occur from a variety of sources. Contamination often results from fugitive emissions during fuel storage and transfer activities, and from leaking valves and pipes. Additionally, the electronics industry, including semiconductor manufacturing, uses highly toxic chlorinated solvents in semiconductor production processes. Sources of air toxics go beyond industry, however. Automobile exhaust also contains toxic air pollutants such as benzene and 1,3-butadiene. Exhaust from trucks, buses, trains, ships, and other equipment with diesel engines contains a mixture of solid particles known as DPM. DPM contains hundreds of different chemicals.

In California, on-road diesel-fueled engines contribute approximately 40 percent of the statewide total DPM, with an additional 57 percent attributed to other mobile sources such as construction and mining equipment, agricultural equipment, and transport refrigeration units.[9] Stationary sources contribute about 5 percent of total DPM.[10] It should be noted that CARB has developed several plans and programs to reduce diesel emissions such as the Diesel Risk Reduction Plan (DRRP), the Statewide Portable Equipment Registration Program (PERP), and the Diesel Off-Road Reporting System (DOORS). The PERP and DOORS programs allow owners or operators of portable engines and certain other types of equipment can register their units to operate their equipment throughout California without having to obtain individual permits from local air districts.

As noted above, diesel exhaust and many individual substances contained in it (including arsenic, benzene, formaldehyde, and nickel) have the potential to contribute to mutations in cells that can lead to cancer. Long-term exposure to diesel exhaust particles poses the highest cancer risk of any TAC evaluated by OEHHA. CARB estimates that about 70 percent of the cancer risk that the average Californian faces from breathing toxic air pollutants stems from diesel exhaust particles.[11]

In its comprehensive assessment of diesel exhaust, OEHHA analyzed more than 30 studies of people who worked around diesel equipment, including truck drivers, railroad workers, and equipment operators. The studies showed these workers were more likely to develop lung cancer than workers not exposed to diesel emissions. These studies provide strong evidence that long-term occupational exposure to diesel exhaust increases the risk of lung cancer. Using information from OEHHA's assessment, CARB estimates that diesel particle levels measured in California's air in 2000 could cause 540 "excess" cancers in a population of 1 million people over a 70-year lifetime.[12] Other researchers and scientific organizations, including the National Institute for Occupational Safety and Health, have calculated cancer risks from diesel exhaust similar to those developed by

[9] California Air Resources Board, California Toxics Inventory, 2013. https://ww2.arb.ca.gov/california-toxics-inventory, accessed March 2025.

OEHHA and CARB.

Exposure to diesel exhaust can have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. In studies with human volunteers, diesel exhaust particles made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks.

The elderly and people with emphysema, asthma, and chronic heart and lung disease are especially sensitive to fine-particle pollution. Numerous studies have linked elevated particle levels in the air to increased hospital admissions, emergency room visits, asthma attacks, and premature deaths among those suffering from respiratory problems. Because children's lungs and respiratory systems are still developing, they are also more susceptible than healthy adults to fine particles. Exposure to fine particles is associated with increased frequency of childhood illnesses and can also reduce lung function in children. In California, diesel exhaust particles have been identified as a carcinogen. In addition, several of the COPCs identified at the Project site are recognized carcinogens. For example, arsenic, hexavalent chromium, and nickel compounds are classified by the U.S. EPA and OEHHA as known human carcinogens; benzene and TCE are listed as carcinogenic air toxics with well-established links to leukemia and other cancers; and PCBs are designated as probable human carcinogens.

2.3 Contaminants of Potential Concern

Generally speaking, contaminated soils can pose a serious environmental and public health concern, particularly at sites undergoing cleanup or redevelopment. When soil contains hazardous substances such as metals or VOCs, potential exposure pathways include direct contact, ingestion, inhalation of dust or vapors, or leaching into groundwater. A pathway is considered complete if a contaminant source, transport mechanism, exposure point, and receptor are all present, resulting in a reasonable potential for exposure. Conversely, pathways lacking one or more of these elements are incomplete and would not result in exposure. These distinctions are especially relevant during construction, when activities such as grading, excavation, and earthwork can disturb subsurface materials and mobilize contaminants into the air.

Based on historical Project site operations, as well as analytical data associated with investigation activities, the following COPCs have been identified for the Project site. The pollutants listed in Table 1: COPCs and Health Risk Data were present at detectable levels and have a Cancer Potency Factor assigned to them as shown in *Appendix A of OEHHA's 2009 Technical Support Document for Cancer Potency Factors*. These pollutants additionally have a Reference Exposure Level (REL) assigned to them by *Appendix A, B, and C of OEHHA's 2015 Air Toxics Hot Spots Program Guidance Manual for the Preparation of Health Risk Assessments*. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated with acute, 8-hour, or chronic exposure to the pollutant. The Cancer Potency Factor, RELs, and sources commonly associated with the pollutants are summarized in Table 1: COPCs and Health Risk Data.

Table 1: COPCs and Health Risk Data

Pollutant	Cancer Potency Slope Factor $(mg/kg\text{-}day)^{-1}$	Acute Reference Exposure Level $(\mu g/m^3)^1$	8-Hour Reference Exposure Level $(\mu g/m^3)^1$	Chronic Reference Exposure Level $(\mu g/m^3)^1$	Major Man-Made Sources
Metals:					
Arsenic	12	0.20	0.015	0.015	Arsenic is a naturally occurring metal that is used in various industrial processes. Common sources of arsenic release include metals production, coal-fired powerplants, arsenic-treated lumber, and arsenic-containing pesticides.
Beryllium	8.4	1	1	0.007	Beryllium is a metal that can be released from both natural and anthropogenic sources. The major anthropogenic source associated with Beryllium release is the disposal of waste which includes electronics and fuel containers.
Cadmium	15	1	1	0.02	Cadmium is a naturally occurring metal that is commonly released from smelters, the burning of fossil fuels, and the incineration of municipal waste such as plastics, electronics, and nickel-cadmium batteries. Other common sources include fungicides and the production of pigments.
Chromium	510	1	1	0.2	Chromium is a naturally occurring metal that is used extensively in the production of stainless steel, alloys, and chrome plating, as well as in pigments, leather tanning, and wood preservation. It exists in several oxidation states, with trivalent chromium (Cr(III)) being an essential nutrient in trace amounts, while hexavalent chromium (Cr(VI)) is highly toxic and recognized as a human carcinogen. The primary sources of large chromium releases to the environment include metal finishing operations, industrial waste disposal, and emissions from combustion processes.
Cobalt	27	1	1	1	Cobalt is a naturally occurring metal that is mainly found in alloys, batteries, catalysts and pigments used for various technologies. The primary source of large cobalt releases includes waste disposal.

Table 1: COPCs and Health Risk Data

Pollutant	Cancer Potency Slope Factor $(mg/kg\text{-}day)^{-1}$	Acute Reference Exposure Level $(\mu g/m^3)^1$	8-Hour Reference Exposure Level $(\mu g/m^3)^1$	Chronic Reference Exposure Level $(\mu g/m^3)^1$	Major Man-Made Sources
Copper	N/A	100	1	1	Copper is a naturally occurring metal that is widely used in electrical wiring, plumbing, roofing, and industrial machinery due to its high conductivity and durability. It is also found in alloys such as bronze and brass and is used in pesticides, wood preservatives, and pigments. The primary sources of large copper releases to the environment include mining and smelting activities, waste disposal, and corrosion of plumbing systems.
Lead	0.042	1	1	1	Lead is a metal found naturally in the environment as well as in manufactured products. The major sources of lead emissions have historically been motor vehicles (such as cars and heavy trucks) and industrial sources. Due to the phase out of leaded gasoline, metals processing is the major source of lead emissions to the air today. The highest levels of lead in air are generally found near lead smelters. Other stationary sources are waste incinerators, utilities, and lead-acid battery manufacturers.
Nickel	0.91	0.2	0.06	0.014	Nickel is a metal found in manufactured metal products including stainless steel, permanent magnets, and other alloy-based products. Nickel is also used in alkaline storage batteries, fuel cell electrodes, and in fuel gases. The primary source of Nickel in the environment is waste disposal and the combustion of fuels.
Selenium	N/A	1	1	20	Selenium is a naturally occurring element that is widely used in electronics, glass manufacturing, pigments, nutritional supplements, and as an additive in animal feed. It occurs in several forms, both organic and inorganic, with varying levels of toxicity. While selenium is an essential trace nutrient for humans and animals at low levels, excessive exposure can be harmful. The primary sources of large selenium releases to the environment include mining and smelting operations, coal-fired power plants, agricultural runoff, and waste disposal.

Mercury	N/A	0.6	0.06	0.03	Mercury is a naturally occurring element that has been used historically in thermometers, dental amalgams, batteries, switches, and industrial processes such as gold mining and chlor-alkali production. It exists in several forms, including elemental mercury, inorganic mercury compounds, and organic mercury compounds such as methylmercury, which is highly toxic and bioaccumulative. The primary sources of large mercury releases to the environment include coal combustion, mining activities, waste incineration, and improper disposal of mercury-containing products.
VOCs[2]:					
1,1,1-Trichloroethane (TCE)	0.2	1	1	1	Trichloroethene (TCE) is a synthetic VOC historically used as an industrial solvent for degreasing metals, as well as in adhesives, paint removers, and cleaning agents. Although many uses have been phased out due to health concerns, TCE remains a common groundwater and soil contaminant at industrial sites. The primary sources of large TCE releases to the environment include improper disposal of industrial solvents, leaking underground storage tanks, and degreasing operations.
1,1-Dichloroethane (DCA)	0.0057	1	1	1	1,2-Dichloroethane (DCA) is a VOC primarily used as a chemical intermediate in the production of vinyl chloride and other industrial chemicals. It has also been used historically as a solvent, degreaser, and in leaded gasoline additives. The primary sources of large DCA releases to the environment include chemical manufacturing facilities, improper disposal of industrial solvents, and leaking storage tanks or pipelines.

Table 1: COPCs and Health Risk Data

Pollutant	Cancer Potency Slope Factor $(mg/kg\text{-}day)^{-1}$	Acute Reference Exposure Level $(\mu g/m^3)^1$	8-Hour Reference Exposure Level $(\mu g/m^3)^1$	Chronic Reference Exposure Level $(\mu g/m^3)^1$	Major Man-Made Sources
1,2-Dichlorobenzene	0.04	1	1	800	1,2-Dichlorobenzene is a VOC that has been used as a solvent in industrial processes, in the manufacture of dyes and resins, and as a degreasing and deodorizing agent. It is also used as a chemical intermediate in the production of other chlorinated compounds. The primary sources of environmental releases include chemical manufacturing, improper disposal of chlorinated solvents, and emissions from waste treatment or incineration facilities.
1,3,5-Trimethylbenzene	N/A	2400	8	4	Ethylbenzene is a VOC that is a component in gasoline, synthetic rubber, paints, and insecticides Ethylbenzene is also present in the production of asphalt. The primary sources of Ethylbenzene in the environment includes petroleum combustion or release, waste disposal, and the use of insecticides.
1,4-Dichlorobenzene	0.04	1	1	800	1,3,5-Trimethylbenzene is a VOC commonly used as a solvent and as an additive in gasoline to improve octane ratings. It is also found in paint thinners, varnishes, and industrial coatings. The primary sources of environmental releases include petroleum refining, fuel combustion, and improper disposal of solvent-containing wastes.
Acrylonitrile	1	1	1	5	Acrylonitrile is a VOC widely used in the manufacture of plastics, synthetic rubber, and acrylic fibers. It is also used as a chemical intermediate in the production of resins and adhesives. The primary sources of acrylonitrile releases to the environment include emissions from chemical manufacturing facilities, improper handling or disposal of industrial waste, and accidental spills.
Benzene	0.1	2.7	3	3	Benzene is a VOC that is added to gasoline, various consumer products including detergent, some pharmaceutical products, and pesticides. The primary sources of benzene in the environment includes oil combustion and extraction, waste disposal, and pesticide usage.

Table 1: COPCs and Health Risk Data

Pollutant	Cancer Potency Slope Factor $(mg/kg\text{-}day)^{-1}$	Acute Reference Exposure Level $(\mu g/m^3)^1$	8-Hour Reference Exposure Level $(\mu g/m^3)^1$	Chronic Reference Exposure Level $(\mu g/m^3)^1$	Major Man-Made Sources
Chlorobenzene	N/A	1	1	1,000	Chlorobenzene is a VOC historically used as a solvent and as an intermediate in the manufacture of pesticides, dyes, adhesives, and rubber. It has also been used in the production of phenol and other industrial chemicals. The primary sources of chlorobenzene releases to the environment include chemical manufacturing, improper disposal of solvent-containing waste, and emissions from incineration processes.
Chloroform	0.019	150	1	300	Chloroform is a VOC that is used to produce dyes, pesticides, and various industrial and waste treatment processes. The primary source of chloroform in the environment is through waste disposal and pesticide usage.
cis-1,2-Dichloroethene	0.0057	1	1	1	Cis-1,2-Dichloroethene (cis-1,2-DCE) is a VOC primarily used as a solvent and in the production of other chlorinated chemicals. It is commonly detected in the environment as a breakdown product of TCE and PCE. The primary sources of environmental releases include improper disposal of chlorinated solvents, leaking underground storage tanks, and industrial waste discharges.
Ethylbenzene	0.0087	1	1	2,000	Ethylbenzene is a VOC that is a component in gasoline, synthetic rubber, paints, and insecticides Ethylbenzene is also present in the production of asphalt. The primary sources of Ethylbenzene in the environment includes petroleum combustion or release, waste disposal, and the use of insecticides.
Styrene	N/A	21,000	1	900	Styrene is a VOC widely used in the production of plastics, synthetic rubber, and resins, including polystyrene and fiberglass-reinforced products. It is released into the environment primarily from industrial manufacturing facilities, plastic production, and emissions from building materials and consumer products. Additional sources include combustion processes and vehicle exhaust.

Table 1: COPCs and Health Risk Data

Pollutant	Cancer Potency Slope Factor $(mg/kg\text{-}day)^{-1}$	Acute Reference Exposure Level $(\mu g/m^3)^1$	8-Hour Reference Exposure Level $(\mu g/m^3)^1$	Chronic Reference Exposure Level $(\mu g/m^3)^1$	Major Man-Made Sources
Tetrachloro-ethene	0.2	1	1	1	Tetrachloroethene (PCE), also known as perchloroethylene, is a VOC commonly used as a dry-cleaning solvent, metal degreaser, and chemical intermediate. It has been one of the most frequently detected groundwater and soil contaminants at industrial and urban sites due to improper disposal, leaks from storage tanks, and historical use in dry-cleaning operations.
Toluene	N/A	5,000	830	420	Toluene is a VOC widely used as an industrial solvent and in the manufacture of paints, coatings, adhesives, and chemical intermediates such as benzene and xylene. It is also a natural constituent of crude oil and gasoline, making vehicle exhaust and fuel handling common sources of environmental releases. The primary sources of toluene contamination include petroleum refining, chemical manufacturing, leaking underground storage tanks, and improper waste disposal.
Trichloroethene	0.057	1	1	1	Trichloroethene is a VOC historically used as a metal degreaser, solvent, and chemical intermediate in the production of refrigerants and other industrial products. Because of widespread industrial use and improper disposal practices, trichloroethene is a common groundwater and soil contaminant at manufacturing and industrial sites. The primary sources of environmental releases include degreasing operations, leaks from underground storage tanks, and waste disposal.
Xylenes	N/A	22,000	1	700	Xylenes are VOCs that exist as three isomers (ortho-, meta-, and para-xylene) and are widely used as solvents in paints, coatings, adhesives, and cleaning agents, as well as in the production of plastics and synthetic fibers. They are also naturally present in petroleum and are common components of gasoline. The primary sources of environmental releases include petroleum refining, vehicle exhaust, leaking underground storage tanks, and industrial solvent use.

Table 1: COPCs and Health Risk Data

Pollutant	Cancer Potency Slope Factor $(mg/kg\text{-}day)^{-1}$	Acute Reference Exposure Level $(\mu g/m^3)^1$	8-Hour Reference Exposure Level $(\mu g/m^3)^1$	Chronic Reference Exposure Level $(\mu g/m^3)^1$	Major Man-Made Sources
SVOCs[3]:					
2,4,6-Tribromophenol	0.07	1	1	1	2,4,6-Tribromophenol (TBP) is a SVOC primarily used as a flame retardant, wood preservative, and chemical intermediate in the production of brominated flame retardants. It is also used as a fungicide and occasionally as an antiseptic. The primary sources of environmental releases include industrial manufacturing processes, treated wood products, and waste disposal from facilities using brominated compounds.
Benzo(a) anthracene	3.9	1	1	1	Benzo(a)anthracene is a SVOC in the polycyclic aromatic hydrocarbon (PAH) family, formed during the incomplete combustion of organic materials such as coal, oil, gas, wood, or tobacco. It is commonly detected in soot, tar, and creosote and may be present at former industrial facilities, waste disposal sites, and areas impacted by combustion processes. The primary sources of environmental releases include industrial emissions, vehicle exhaust, and the burning of fossil fuels and biomass.
Bis(2-chloroethyl)ether	2.5	1	1	1	Bis(2-chloroethyl)ether is a synthetic SVOC historically used as a chemical intermediate in the manufacture of pesticides, resins, and other organic chemicals. It has also been used in limited applications as a solvent and in the production of plastics and rubber. Releases to the environment may occur from industrial processes, improper disposal, and waste sites associated with historical manufacturing activities.
Chrysene	0.039	1	1	1	Chrysene is a SVOC belonging to the PAH family. It is generated primarily during the incomplete combustion of organic materials such as coal, oil, gas, wood, and tobacco. Environmental sources include industrial emissions, vehicle exhaust, residential wood burning, and deposits from fossil fuel combustion. Chrysene is commonly found in soot, tar, creosote, and impacted soils at former industrial or waste disposal sites.

Table 1: COPCs and Health Risk Data

Pollutant	Cancer Potency Slope Factor $(mg/kg\text{-}day)^{-1}$	Acute Reference Exposure Level $(\mu g/m^3)^1$	8-Hour Reference Exposure Level $(\mu g/m^3)^1$	Chronic Reference Exposure Level $(\mu g/m^3)^1$	Major Man-Made Sources
Dibenz(a,h)anthr-acene	4.1	1	1	1	Dibenz(a,h)anthracene is a SVOC classified as a PAH. It is formed during the incomplete combustion of organic matter such as coal, oil, wood, and tobacco. Environmental contamination is typically associated with industrial emissions, vehicle exhaust, residential wood burning, and waste disposal sites where combustion byproducts accumulate.
Hexachloro-benzene	1.8	1	1	1	Hexachlorobenzene (HCB) is a persistent, SVOC historically used as a fungicide and as an intermediate in the manufacture of other chlorinated chemicals, including solvents, pesticides, and rubber compounds. Releases may occur from legacy contamination at former industrial or waste disposal sites, as well as byproducts of chemical manufacturing and combustion processes.
Indeno(1,2,3-cd)pyrene	0.39	1	1	1	Indeno(1,2,3-cd)pyrene is a SVOC classified as a PAH. It is produced primarily from the incomplete combustion of fossil fuels, wood, and other organic materials. Major environmental sources include vehicle exhaust, coal and oil combustion, residential wood burning, and industrial emissions.
Naphthalene	0.12	1	1	9	Naphthalene is a SVOC that is commonly found in fumigant and insecticides. Naphthalene is also a component in petroleum, coal, and various industrial processes. The primary sources of Naphthalene in the environmental include insecticide usage, oil combustion, and waste disposal
Phenol	N/A	5,800	1	200	Phenol is a SVOC widely used in the manufacture of resins, plastics, pharmaceuticals, and other industrial chemicals. It can also be released into the environment through combustion processes, industrial discharges, and waste disposal activities.

1. When the REL was not available, a default value of 1 $\mu g/m^3$ was conservatively applied as a health-protective placeholder to avoid underestimating risk and to ensure that pollutants with unknown toxicity are included in this analysis.
2. Volatile Organic Compounds (VOCs or Reactive Organic Gases [ROG]) are hydrocarbons/organic gases that are formed solely of hydrogen and carbon. There are several subsets of organic gases including ROGs and VOCs. Both ROGs and VOCs are emitted from the incomplete combustion of hydrocarbons or other carbon-based fuels.
3. Semi-Volatile Organic Compounds (SVOCs) are a subgroup of VOCs that are not as volatile and tend to have higher molecular weights and boil point temperatures than other VOCs.

2.4 Health Risk Sensitive Receptors

Sensitive populations are more susceptible to the effects of air pollution than is the general population. Sensitive receptors that are in proximity to localized TAC sources are of particular concern. Land uses considered sensitive receptors include residences, schools, playgrounds, childcare centers, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes. Consistent with the Bay Area Air District CEQA Air Quality Guidelines (April 2022), sensitive receptors are defined as facilities or land uses that house or attract children, the elderly, people with illnesses, or others who are especially vulnerable to the effects of air pollutants. The Project site is primarily surrounded by industrial land uses. Sensitive land uses nearest to the Project are listed in Table 2: Sensitive Receptors.

Table 2: Sensitive Receptors	
Receptor Description	**Distance and Direction from the Project[1]**
Single-Family Residence[2]	625 feet to the northeast
Temporary Shelter for the Unhoused[3]	730 feet to the west
1. Distance measured from the Project boundary line to the property line of the sensitive receptor. 2. Residence is located at 867 75th Avenue. 3. The City of Oakland Environmental Justice Element (2023) identified the temporary shelter for unhoused persons as a sensitive land use.	
Source: Google Earth, 2025.	

3.0 REGULATORY SETTING

3.1 Federal

U.S. EPA

The United States Environmental Protection Agency (U.S. EPA) uses Regional Screening Levels (RSLs) as health-protective screening tools to evaluate contaminants in soil, air, and water during environmental site assessments. These values help determine whether a chemical may pose a potential health risk and if further analysis is necessary. While not enforceable standards, RSLs guide the need for more detailed human health risk assessments when contaminant concentrations exceed screening thresholds.

Federal Clean Air Act

The FCAA was amended in 1990 to address the numerous air pollutants that are known to cause or may reasonably be anticipated to cause adverse effects to human health or adverse environmental effects. 188 specific pollutants and chemical groups were initially identified as HAPs, and the list has been modified over time. The FCAA Amendments included new regulatory programs to control acid deposition and for the issuance of stationary source operating permits.

In 2001, the U.S. EPA issued its first Mobile Source Air Toxics Rule, which identified 21 mobile source air toxic (MSAT) compounds as being HAPs that required regulation. A subset of six of these MSAT compounds were identified as having the greatest influence on health and included benzene, 1,3-butadiene, formaldehyde, acrolein, acetaldehyde, and DPM. More recently, the U.S. EPA issued a second MSAT Rule in February 2007, which generally supported the findings in the first rule and provided additional recommendations of compounds having the greatest impact on health. The rule also identified several engine emission certification standards that must be implemented. Unlike the criteria pollutants, toxics do not have National Ambient Air Quality Standards (NAAQS) making evaluation of their impacts more subjective.

National Emissions Standards for Hazardous Air Pollutants (NESHAPs) were incorporated into a greatly expanded program for controlling toxic air pollutants. The provisions for attainment and maintenance of the NAAQS were substantially modified and expanded. Other revisions included provisions regarding stratospheric ozone protection, increased enforcement authority, and expanded research programs.

FCAA Amendments Section 112 governs the federal control program for HAPs. NESHAPs are issued to limit the release of specified HAPs from specific industrial sectors. These standards are technology-based, meaning that they represent the best available control technology an industrial sector could afford. The level of emissions controls required by NESHAPs are not based on health risk considerations because allowable releases and resulting concentrations have not been determined to be safe for the general public. The FCAA does not establish air quality standards for HAPs that define legally acceptable concentrations of these pollutants in ambient air.

Federal Emissions Standards for On-Road Trucks

To reduce emissions from on-road, heavy-duty diesel trucks, the U.S. EPA established a series of

increasingly strict emission standards for new engines, starting in 1988. The U.S. EPA promulgated the final and cleanest standards with the 2007 Heavy-Duty Highway Rule.[13] The particulate matter (PM) emission standard of 0.01 gram per horsepower-hour (g/hp-hr) is required for new vehicles beginning with model year 2007. Also, the nitrogen oxide (NO_X) and nonmethane hydrocarbon (NMHC) standards of 0.20 g/hp-hr and 0.14 g/hp-hr, respectively, were phased in together between 2007 and 2010 on a percent of sales basis: 50 percent from 2007 to 2009 and 100 percent in 2010.

Emission Standards for Off-Road Diesel Engines

To reduce emissions from off-road diesel equipment, the U.S. EPA established a series of cleaner emission standards for new off-road diesel engines.[14] Tier 1 standards were phased in from 1996 to 2000 (year of manufacture), depending on the engine horsepower category. Tier 2 standards were phased in from 2001 to 2006. Tier 3 standards were phased in from 2006 to 2008. Tier 4 standards, which are incorporated into manufacturing of new equipment or attained through add-on emission control equipment, were phased in from 2008 to 2015. The Tier 4 standards require that emissions of PM and NO_X be further reduced by about 90 percent from Tier 3 standards. CARB is currently developing potential amendments to the off-road diesel engine standards, in a Tier 5 rulemaking. The Tier 5 rulemaking aims to reduce NO_X and PM emissions from new, off-road compression-ignition (CI) engines, by an additional 50 percent to 90 percent, compared to what is allowed by today's Tier 4 final emission standards.

3.2 State of California

California Office of Environmental Health Hazard Assessment

The California Office of Environmental Health Hazard Assessment (OEHHA) develops health-based guidelines used to assess risks from environmental contaminants. OEHHA provides toxicity values, exposure factors, and risk assessment methodologies that are widely used in HRAs under CEQA. Its work supports regulatory decisions and helps protect public health by ensuring consistent, science-based evaluations of chemical exposures.

California Environmental Quality Act

CEQA requires state and local agencies to assess and disclose the environmental impacts of proposed projects and to avoid or mitigate significant adverse effects when feasible. Under CEQA, human health risks are evaluated as part of a project's potential environmental impacts. CEQA documents may generalize or exclude detailed health analyses unless individual health effects are part of a broader environmental concern, such as cumulative air pollution impacts. A multipollutant HRA is required when a project emits multiple TACs or pollutants that could pose a significant cumulative health risk, particularly near sensitive receptors. Multipollutant HRAs are commonly required for projects involving hazardous materials or soil remediation, especially when emissions

[13] United States Environmental Protection Agency (U.S. EPA), Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards and Highway Diesel Fuel Sulfur Control Requirements, Final Rule: 40 Code of Federal Regulations, Parts 69, 80, and 86. January 18, 2001.

[14] U.S. EPA, *Regulations for Emissions from Heavy Equipment with Compression-Ignition (Diesel) Engines*, 2024. Available at: https://www.epa.gov/regulations-emissions-vehicles-and-engines/regulations-emissions-heavy-equipment-compression, accessed March 2025.

could combine to exceed established health risk thresholds.

California Air Resources Board

CARB's statewide comprehensive air toxics program was established in 1983 with AB 1807 the Toxic Air Contaminant Identification and Control Act (Tanner Air Toxics Act of 1983). AB 1807 created California's program to reduce exposure to air toxics and sets forth a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an airborne toxics control measure (ATCM) for sources that emit designated TACs. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate toxics best available control technology (T-BACT) to minimize emissions.

CARB also administers the state's mobile source emissions control program and oversees air quality programs established by state statute, such as AB 2588. Under AB 2588, TAC emissions from individual facilities are quantified and prioritized by the air quality management district or air pollution control district. High priority facilities are required to perform a health risk assessment and, if specific thresholds are exceeded, required to communicate the results to the public in the form of notices and public meetings. In September 1992, AB 2588 was amended by Senate Bill (SB) 1731 which required facilities that pose a significant health risk to the community to reduce their risk through a risk management plan.

Diesel Risk Reduction Plan

The identification of DPM as a TAC in 1998 led CARB to adopt the *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles* (DRRP) in October 2000. The DRRP's goals include an 85 percent reduction in DPM by 2020 from the 2000 baseline. CARB estimates that emissions of DPM in 2035 will be less than half those in 2010, further reducing statewide cancer risk and non-cancer health effects.[15] The DRRP includes regulations to establish cleaner new diesel engines, cleaner in-use diesel engines (retrofits), and cleaner diesel fuel.

Truck and Bus Regulation Reducing Emissions from Existing Diesel Vehicles

On December 12, 2008, CARB approved the Truck and Bus Regulation to significantly reduce PM and NO_X emissions from existing diesel vehicles operating in California. The regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. As of January 1, 2023, nearly all trucks and buses must have 2010 model year engines or equivalent.

The regulation applies to most privately and federally-owned diesel fueled trucks and buses and to privately and publicly owned school buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. Small fleets with three or fewer diesel trucks can delay compliance for heavier trucks and there are several extensions for low-mileage construction trucks, early PM filter retrofits, adding cleaner vehicles, and other situations. Privately and publicly owned school buses have different requirements.

[15] California Air Resources Board, *Overview: Diesel Exhaust & Health, available at: https://ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health*, accessed March 2025.

Heavy-Duty Vehicle Idling Emission Reduction Program

The purpose of the CARB ATCM to Limit Diesel-Fueled Commercial Motor Vehicle Idling is to reduce public exposure to diesel particulate matter and criteria pollutants by limiting the idling of diesel-fueled commercial vehicles. The driver of any vehicle subject to this ATCM is prohibited from idling the vehicle's primary diesel engine for greater than five minutes at any location and is prohibited from idling a diesel-fueled auxiliary power system (APS) for more than five minutes to power a heater, air conditioner, or any ancillary equipment on the vehicle if it has a sleeper berth and the truck is located within 100 feet of a restricted area (homes and schools).

CARB Final Regulation Order, Requirements to Reduce Idling Emissions from New and In-Use Trucks, beginning in 2008, requires that new 2008 and subsequent model-year heavy-duty diesel engines be equipped with an engine shutdown system that automatically shuts down the engine after 300 seconds of continuous idling operation once the vehicle is stopped, the transmission is set to "neutral" or "park", and the parking brake is engaged.

Section 2485 and Section 2449 of Title 13 of the California Code of Regulations limits diesel-fueled motor vehicle idling to no more than five minutes. Section 2485 limits idling for diesel-fueled commercial motor vehicles with gross vehicle weight ratings of greater than 10,000 pounds that are or must be licensed to operate on publicly maintained highways and streets within California. Section 2449 limits idling for off-road diesel-fueled fleets.

CARB Advanced Clean Truck Regulation

CARB adopted the Advanced Clean Truck (ACT) Regulation in June 2020 requiring truck manufacturers to transition from diesel trucks and vans to electric zero-emission trucks beginning in 2024. By 2045, every new truck sold in California is required to be zero-emission. This rule directly addresses disproportionate risks and health and pollution burdens and puts California on the path for an all zero-emission short-haul drayage fleet in ports and railyards by 2035, and zero-emission "last-mile" delivery trucks and vans by 2040. The Advanced Clean Truck Regulation accelerates the transition of zero-emission medium-and heavy-duty vehicles from Class 2b to Class 8. The regulation has two components including a manufacturer sales requirement, and a reporting requirement:

Zero-Emission Truck Sales: Manufacturers who certify Class 2b through 8 chassis or complete vehicles with combustion engines are required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales need to be 55 percent of Class 2b – 3 truck sales, 75 percent of Class 4 – 8 straight truck sales, and 40 percent of truck tractor sales.

Company and Fleet Reporting: Large employers including retailers, manufacturers, brokers and others would be required to report information about shipments and shuttle services. Fleet owners, with 50 or more trucks, would be required to report about their existing fleet operations. This information would help identify future strategies to ensure that fleets purchase available zero-emission trucks and place them in service where suitable to meet their needs.

The ACT regulation was granted a separate waiver from the Federal Clean Air Act in 2023 by the Biden administration. On May 22, 2025, the U.S. Senate voted to revoke the waiver granted by the Biden

administration for California's ACT rule (as well as the Advanced Clean Cars II program and Heavy-Duty Omnibus regulation). On June 12, 2025, President Trump formally nullified California's ACT rule and Advanced Clean Cars II program (Congressional Resolution H.J. Res 88). Therefore, implementation of these regulations is currently unknown.

Advanced Clean Cars I and II

Advanced Clean Cars combines several regulations into one package including the Low-Emission Vehicle (LEV) criteria and greenhouse gas regulations and the zero-emission vehicle (ZEV) regulation. Advanced Clean Cars I was adopted in 2012 and Advanced Clean Cars II was adopted in 2022. These regulations rapidly scale down emissions of light-duty passenger cars, pickup trucks and sport utility vehicles (SUVs) and require an increased number of zero-emission vehicles to meet air quality and climate change emissions goals. By 2035 all new passenger cars, trucks and SUVs sold in California will be zero emissions. The Advanced Clean Cars II regulations take the state's already growing zero-emission vehicle market and robust motor vehicle emission control rules and augments them to meet more aggressive tailpipe emissions standards and ramp up to 100 percent zero-emission vehicles.

ARB Advanced Clean Fleets Regulation. CARB approved Advanced Clean Fleets Regulation (ACF) on April 28, 2023, requires fleet owners to begin transitioning toward ZEVs starting in 2024. Due to the impact that truck traffic has on residents living near heavily trafficked corridors, drayage trucks will need to be zero-emissions by 2035. All other fleet owners have the option to transition a percentage of their vehicles to meet expected zero-emission milestones, which gives owners the flexibility to continue operating combustion-powered vehicles as needed during the move toward cleaner technology. As noted above, the Advanced Clean Cars II program was nullified by Congressional Resolution H.J. Res 88. Therefore, implementation of this regulation is currently unknown and is not considered in emissions estimates.

CARB Advanced Clean Fleets Regulation

CARB approved Advanced Clean Fleets Regulation (ACF) on April 28, 2023, requires fleet owners to begin transitioning toward ZEVs starting in 2024. Due to the impact that truck traffic has on residents living near heavily trafficked corridors, drayage trucks will need to be zero-emissions by 2035. All other fleet owners have the option to transition a percentage of their vehicles to meet expected zero-emission milestones, which gives owners the flexibility to continue operating combustion-powered vehicles as needed during the move toward cleaner technology. On January 13, 2025, CARB withdrew their FCAA waiver request to U.S. EPA for the Advanced Clean Fleets Regulation. Therefore, the implementation status of this regulation is currently unknown and is not considered in emissions estimates.

Executive Order N-79-20

Signed in September 2020, Executive Order N-79-20 establishes as a goal that where feasible, all new passenger cars and trucks, as well as all drayage/cargo trucks and off-road vehicles and equipment, sold in California, will be zero-emission by 2035. The executive order sets a similar goal requiring that all medium and heavy-duty vehicles will be zero-emission by 2045 where feasible. It also directs CARB to develop and propose rulemaking for passenger vehicles and trucks, medium-

and heavy-duty fleets where feasible, drayage trucks, and off-road vehicles and equipment "requiring increasing volumes" of new zero emission vehicles (ZEVs) "towards the target of 100 percent." The executive order directs the California Environmental Protection Agency, the California Geologic Energy Management Division (CalGEM), and the California Natural Resources Agency to transition and repurpose oil production facilities with a goal toward meeting carbon neutrality by 2045. Executive Order N-79-20 builds upon the CARB Advanced Clean Trucks regulation, which was adopted by CARB in July 2020.

CalEnviroScreen

OEHHA has developed CalEnviroScreen 4.0, which is a mapping tool that helps identify California communities that are most affected by many sources of pollution, and where people are often especially vulnerable to pollution's effects. CalEnviroScreen uses environmental, health, and socioeconomic information to produce scores for every census tract in the State. The scores are mapped so that different communities can be compared. An area with a high score is one that experiences a much higher pollution burden than areas with low scores.

According to CalEnviroScreen, the Project site and the surrounding area is located within Census Tract 6001408900, which is within the 90th percentile.[16] CalEnviroScreen ranks communities based on data that are available from state and federal government sources and the CalEnviroScreen scores are relative to other census tracts and are not an expression of health risk, and do not provide quantitative information on increases in cumulative impacts for specific sites or projects. The State uses CalEnviroScreen to prioritize California Climate Investments to benefit disadvantaged communities and to prioritize outreach in vulnerable communities. Further, as a comparative screening tool, the results do not provide a basis for determining when differences between scores are significant in relation to public health or the environment.

Senate Bill 535

Senate Bill (SB) 535 directs 25 percent of the proceeds from the Greenhouse Gas Reduction Fund (i.e., funds from the AB 32 cap-and-trade program) to go to projects that provide a benefit to disadvantaged communities (DACs) (as identified by the OEHHA mapping). These funds must be used for programs that further reduce greenhouse gas emissions. Funding programs that reduce greenhouse gas emissions would also potentially reduce exposure to other emissions including TACs. Based on OEHHA mapping, the closest SB 535 designated disadvantaged community is located approximately six miles northeast of the Project site (Census Tract 6001408900).[17] SB 535 does not include project specific requirements or prohibit developments in proximity to the designated communities.

AB 617 Community Air Protection Program

AB 617 was promulgated into state law in 2017. The purpose of this legislation is for CARB to establish the Community Air Protection Program (CAPP). CARB's objective in implementing the

[16] Office of Environmental Health Hazard Assessment, CalEnviroScreen 4.0, https://experience.arcgis.com/experience/11d2f52282a54ceebcac7428e6184203/page/CalEnviroScreen-4_0/, accessed March 2025.

[17] California Office of Environmental Health Hazard Assessment, *SB 535 Disadvantaged Communities (2022 Update)*, https://oehha.ca.gov/calenviroscreen/sb535, accessed March 2025.

CAPP is to reduce human health risk levels by reducing air toxics exposure in communities most impacted by TAC emissions. CARB requires that air districts "must initiate community partnerships and undertake a robust public process in developing and implementing the community emissions reduction programs." There have been 17 designated communities throughout the state targeting emissions reductions, community monitoring or both. The majority of AB 617 communities have both reduction and monitoring designations. The state legislature has provided a funding mechanism to support early actions allowing for deployment of cleaner technologies for designated communities as well as grants to promote community participation in both the monitoring and emissions reductions aspects of the program. Other aspects of the program include accelerated retrofit of pollution controls on industrial stationary sources, an increase in financial penalties, and increased transparency and availability of emissions and air quality information thereby driving air pollution control efforts statewide with a goal of improved intra- Air District communication and cooperation.

The Project site is located within East Oakland which was designated a CAPP community in 2021. East Oakland was selected amongst high priority communities in the Bay Area due to longstanding air quality challenges, environmental justice issues, and health inequities. The East Oakland community is home to major goods movement and transportation corridors, as well as air pollution sources associated with industry and the trucking industries. Data shows residents of this community have lower life expectancies and higher mortality rates from lung diseases due to constant exposure to air pollution. This community has a higher rate of asthma emergency room visits and cardiovascular disease than most of California. It also has some of the highest unemployment and housing cost burdens and some of the lowest educational attainment and life expectancy in the State.

East Oakland organizations have partnered with the Bay Area Air District to build community capacity, increase understanding of local air pollution and environmental justice issues, and bring together cross-agency partnerships necessary for improving environmental health and local air quality improvement. The Bay Area Air District is partnering with Communities for a Better Environment and other community-based organizations to create a community-based Steering Committee to develop the East Oakland AB 617 Community Emissions Reduction Plan.

3.3 Regional

Bay Area Air Quality Management District

The Bay Area Air District is the regional agency tasked with managing air quality in the region and has regulated TACs since the 1980s. The CCAA provides the Bay Area Air District with the authority to manage transportation activities as indirect sources and regulate stationary source emissions. Indirect sources of pollution are generated when minor sources collectively emit a substantial amount of pollution.

Under Bay Area Air District Regulation 2-1 (General Permit Requirements), Regulation 2-2 (New Source Review), and Regulation 2-5 (New Source Review), all nonexempt sources that possess the potential to emit TACs are required to obtain permits from Bay Area Air District. Permits may be granted to these operations if they are constructed and operated in accordance with applicable regulations, including new source review standards and air toxics control measures. The Bay Area

Air District limits emissions and public exposure to TACs through several programs. Section 301 of Regulation 2, Rule 2, requires Best Available Control Technology (BACT) and is triggered for any new or modified source with the potential to emit specific levels of pollutants. The Bay Area Air District prioritizes TAC-emitting stationary sources for regulation based on the quantity and toxicity of the TAC emissions and the proximity of the facilities to sensitive receptors.

The Bay Area Air District has published California Environmental Quality Act (CEQA) Air Quality Guidelines that are used in this assessment to evaluate health risk impacts of projects.

Community Air Risk Evaluation Program

The Bay Area Air District's Community Air Risk Evaluation (CARE) program estimates and reports both local and regional impacts of TACs in the Bay Area. The objective of the CARE Program is to reduce health impacts linked to local air quality. The goals of the CARE Program are to: (1) identify areas where air pollution contributes most to health impacts and where populations are most vulnerable to air pollution; (2) apply sound scientific methods and strategies to reduce health impacts in these areas; and (3) engage community groups and other agencies to develop additional actions to reduce local health impacts. Information from the CARE program is used by the Bay Area Air District to design and focus effective mitigation measures in areas with highest impacts.

4.0 SIGNIFICANCE CRITERIA AND METHODOLOGY

4.1 Health Risk Analysis Thresholds

Project health risks are determined by examining the types and levels of air toxics generated and the associated impacts on factors that affect air quality. This analysis also addresses the CEQA significance criterion related to exposing sensitive receptors to substantial pollutant concentrations, which evaluates whether emissions of TACs could result in significant health risks. The Bay Area Air District publishes the CEQA Air Quality Guidelines, which were most recently updated in April 2022. The Bay Area Air District thresholds for air toxic emissions that are used for this project are shown below:

Individual Projects:

- **Excess (Incremental) Cancer Risk:** Emit contaminants that result in a maximum individual cancer risk (MICR) equals or exceeds 10 in one million.
- **Non-Cancer Risk:** Emit contaminants that exceed the maximum hazard index of 1.0 in one million.
- **Ambient $PM_{2.5}$ Concentration:** Incremental increase in average annual $PM_{2.5}$ concentration greater than 0.3 µg/m^3

Cumulative Thresholds:

- **Excess Cancer Risk:** Emit contaminants that would contribute to cumulative emissions, resulting in an exceedance of the MICR of 100 in one million.
- **Non-Cancer Risk:** Emit contaminants that that would contribute to cumulative emissions, resulting in an exceedance of the maximum hazard index of 10.0 in one million.
- **Ambient $PM_{2.5}$ Concentration:** Incremental increase in average cumulative annual $PM_{2.5}$ concentration of greater than 0.8 µg/m^3

Cancer risk is expressed in terms of expected incremental incidence per million population. The Bay Area Air District has established an individual project incidence rate of 10 persons per million as the maximum acceptable incremental cancer risk. The 10 in one million standard is a health-protective significance threshold. A risk level of 10 in one million implies a likelihood that up to 10 persons, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the levels of TACs over a specified duration of time. This risk would be an excess cancer that is in addition to any cancer risk borne by a person not exposed to these TACs.

The Bay Area Air District has also established non-carcinogenic risk parameters for use in HRAs. Noncarcinogenic risks are quantified by calculating a hazard index (HI), expressed as the ratio between the ambient pollutant concentration and its toxicity or Reference Exposure Level (REL). An REL is a concentration at or below which health effects are not likely to occur. A HI less than 1.0 means that adverse health effects are not expected. Within this analysis, non-carcinogenic exposures of less than 1.0 are considered less than significant.

The 2022 Bay Area Air District CEQA Air Quality Guidelines recommend assessing impacts within 1,000 feet of the project. The 1,000-foot radius is consistent with findings in CARB's Air Quality and Land Use Handbook (2005) and the California Health & Safety Code §42301.6 (Notice for Possible Source Near School). The 2005 CARB Air Quality and Land Use Handbook found that TAC concentrations are reduced substantially at a distance 1,000 feet downwind from sources such as freeways or large distribution centers.

4.2 Methodology

This HRA evaluates potential health risks associated with DPM and TAC emission resulting from Project implementation. Construction equipment and associated heavy-duty truck traffic generate diesel exhaust, which is a known TAC. DPM emissions from construction equipment operating at the site poses a health risk to nearby sensitive receptors. Operational activities would also include the use of heavy-duty diesel trucks that emit DPM.

Soils disturbed during earthwork at the former foundry site may be impacted with TACs and other hazardous substances associated with historical foundry operations. Potential contaminants include heavy metals from casting and smelting activities, PAHs from fuel combustion and finishing processes, solvents and degreasing agents historically used in equipment cleaning and maintenance, petroleum hydrocarbons from fuel storage and leaks, and residual materials from wastewater treatment operations. Materials potentially impacted by these contaminants would be segregated, characterized, and managed appropriately, including off-site transport and disposal at approved receiving facilities.

Construction Sources

DPM Emissions

Construction would generate DPM emissions from the use of off-road diesel equipment required for grading and excavation, paving, and other construction activities. For construction activity, DPM is the primary TAC of concern. Although DPM is a subset of PM_{10} exhaust, the analysis conservatively assumes all $PM_{2.5}$ exhaust emissions are DPM.[18] On-road diesel-powered haul trucks traveling to and from the construction area to deliver materials and equipment are less of a concern because they would not stay on the site for long durations. Diesel exhaust from construction equipment operating at the site potentially poses a health risk to nearby sensitive receptors. The nearest residence to the Project site is located approximately 625 feet to the northeast.

Health-related risks associated with diesel-exhaust emissions are primarily linked to long-term exposure and the associated risk of contracting cancer. The use of diesel-powered construction equipment would be episodic and would occur throughout the Project site. Construction activities would limit idling to no more than five minutes pursuant to Section 2485 and Section 2449 of Title 13 of the California Code of Regulations, which would further reduce nearby sensitive receptors' exposure to temporary and variable DPM emissions. Furthermore, even during the most intense period of construction, emissions of DPM would be generated from different locations on the Project

[18] More than 90 percent of DPM is less than 1 µm in diameter and is a subset of $PM_{2.5}$. Thus, assuming $PM_{2.5}$ as the surrogate for DPM constitutes a conservative analysis. CARB, *Inhalable Particulate Matter and Health ($PM_{2.5}$ and PM_{10})*: https://ww2.arb.ca.gov/resources/inhalable-particulate-matter-and-health. CAPCOA and CARB, *Non-Vehicular Diesel Engine Risk Assessment Guidance*, July 2024.

site rather than in a single location because different types of construction activities (e.g., site preparation and building construction) would not occur at the same place at the same time. Construction emissions rates for $PM_{2.5}$ (DPM) were calculated from the CalEEMod construction emissions modeling conducted for the Project.

Project construction was modeled to begin April 2027 with a construction duration of approximately 22 months and would include 646,343 square feet of demolition, including the existing building and pavement. Additionally, there would be approximately 2,100 cubic yards (cy) of soil export and 18,806 cy of soil import during construction. The construction schedules are shown in Table 3: Construction Schedule.

Table 3: Construction Schedule

Phase Type	Start	End
Demolition	April 2027	June 2027
Site Preparation	June 2027	July 2027
Grading	July 2027	August 2027
Infrastructure Improvements	August 2027	December 2027
Building Construction	January 2028	September 2028
Paving	October 2028	November 2028
Architectural Coating	December 2028	January 2029

Source: Refer to Appendix A: Modeling Data.

As described above, $PM_{2.5}$ exhaust construction emissions over the entire construction period were used in AERMOD to approximate construction DPM emissions. AERMOD requires meteorological, traffic volumes, and vehicle emissions data. Meteorological data used in the HRA is discussed below. AERMOD provides concentrations in an isopleth to visually show the dispersion of the pollutant. All AERMOD assumptions, input data, and outputs are provided herein. Risk levels were calculated based on the California Office of Environmental Health Hazard Assessment (OEHHA) guidance document, *Air Toxics Hot Spots Program Risk Assessment Guidelines* (February 2015).

TAC Emissions from COPCs

To analyze the health risk associated with TACs released from impacted soil during construction, a multipollutant analysis was conducted based on the results of the Data Gap Investigation, the Phase II ESA, and the identified pollutants of concern shown in Table 1: COPCs and Health Risk Data. Pollutant emission rates were calculated by determining the daily amount of pollutant released, using the volume and density of impacted soil, the dust release rate, and pollutant concentration, normalized by the total mass of disturbed soil. Specifically, emission rates for each of the pollutants by site was calculated using the following formula:

$$\text{Emission rate}_p = (cy_{is} * BD * DR_{ts} * C)/m_{ts}$$

Emission Rate_p = milligrams of pollutant excavated per day (mg_p/day)

Cy_{is} = cubic yards of impacted soil (cy)

BD = Bulk density of the soil (kg/cy)

DR_{ts} = Rate of total dust release (kg/day)

C = Concentration of pollutant from (mg/kg)

m_{ts} = mass of the total soil disturbed (kg)

Calculation of the emission rates required specific conservative assumptions including the total cubic yards disturbed on the Project site, the depth of grading activities across the entire Project site, and the width and depth of excavation for sewer and stormwater pipeline removal and replacement. Table 4: Pollutants Rates show the pollutant rates for each pollutant identified in Table 1: COPCs and Health Risk Data. A list of the assumptions are shown below.

Table 4: Pollutants Rates

Pollutant	Pollutant Emissions Rates (lbs/day)[1]		
	Grading	Trenching	Stockpiles

Table 4: Pollutants Rates

Pollutant	Pollutant Emissions Rates (lbs/day)[1]		
	Grading	Trenching	Stockpiles

1. The pollutant concentrations presented do not account for the implementation of related to soil handling, stockpile management, and dust suppression. As such, the analysis reflects a conservative estimate of potential emissions and health risks, and actual impacts are expected to be lower with implementation of SCAs and SOPs.
2. When the REL was not available, a default value of 1 $\mu g/m^3$ was conservatively applied as a health-protective placeholder to avoid underestimating risk and to ensure that pollutants with unknown toxicity are included in this analysis.
3. Volatile Organic Compounds (VOCs or Reactive Organic Gases [ROG]) are hydrocarbons/organic gases that are formed solely of hydrogen and carbon. There are several subsets of organic gases including ROGs and VOCs. Both ROGs and VOCs are emitted from the incomplete combustion of hydrocarbons or other carbon-based fuels.
4. Semi-Volatile Organic Compounds (SVOCs) are a subgroup of VOCs that are not as volatile and tend to have higher molecular weights and boil point temperatures than other VOCs.

Source: California Office of Environmental Health Hazard Assessment. *Chemicals Database*. Retrieved from https://oehha.ca.gov/chemicals.
California Office of Environmental Health Hazard Assessment. *OEHHA Acute, 8-hour and Chronic Reference Exposure Level (REL) Summary*. Retrieved from https://oehha.ca.gov/air/general-info/oehha-acute-8-hour-and-chronic-reference-exposure-level-rel-summary.

- **Identification of Pollutant Concentrations.** Concentrations for the metals, VOCs, and SVOCs at the Project site were derived from the threshold for detection listed in the Data Gap Investigation. For pollutants that were detected at some sampling and boring locations but reported as non-detect at others, one-half of the detection limit was applied in the evaluation, consistent with U.S. EPA risk assessment guidance for handling non-detect data. Pollutants that were consistently reported as non-detect across all sampling and boring locations were excluded from further evaluation.

- **Grading.** Project grading activities were assumed to disturb approximately 53,500 cy of soil over the 14.9-acre site. The average depth of soil disturbance during the grading activities was assumed to be 2 feet. The duration of soil disturbance during the grading phase was assumed to be approximately 110 days.

- **Excavation.** Project excavation activities associated with the sewer and stormwater pipeline removal and replacement were assumed to disturb approximately 5,400 cy of soil. The average depth and width of soil disturbance during the excavation activities was assumed to be 11 feet. The duration of soil disturbance during the excavation activities was assumed to be approximately 110 days.

- **Stockpiles.** Soil generated during excavation activities for the removal and replacement of sewer and stormwater pipelines was assumed to be temporarily stored in stockpiles. Each stockpile was estimated to contain approximately 2,700 cy of excavated soil, resulting in a total of about 5,400 cy of soil to be managed on-site. The stockpiles were assumed to remain on-site for an approximate duration of 44 days.

- **Metals Emissions Calculations.** Metals emissions from soil disturbance were quantified using site-specific soil chemistry from the Data Gap Investigation and standard fugitive-dust estimation methods. The calculations applied a 3 percent airborne-loss factor to represent construction-phase dust generation, with emissions applied to individual metals based on their measured concentrations. Particulate matter from grading was characterized consistent with EPA AP-42 (Chapter 13.2.3) heavy-construction guidance, using a project-specific grading emission factor of 3.2 pounds of PM per acre-day.

- **VOCs and SVOCs Emissions Calculations.** VOC emissions from excavation activities were

estimated using site-specific soil data and U.S. EPA guidance. Pollutant concentrations were identified based on the results of the Data Gap Investigation. Emission rates were calculated using the U.S. EPA methodology Estimating Air Emissions from Petroleum UST Cleanups (EPA, 1995), which provides standardized equations for estimating VOC releases during soil excavation. This methodology incorporates soil concentration data, excavation rates, and volatilization factors to derive estimated daily emission rates for each VOC of concern.

Construction emissions sources were calculated based on Project-specific activity levels. This analysis only evaluates the environmental impact of the contaminants located within the soil that would be disturbed during excavation, grading, removal and replacement of sewer and stormwater pipelines, and dust released during movement of construction equipment. See Appendix A for more information regarding the construction assumptions used in this analysis, as well as the modeled emissions. Construction emissions can vary substantially from day to day, depending on the level of activity, and the specific type of equipment used. For this analysis, construction emissions result from on-site activities.

Operational Sources

Mobile Sources

The Project is located within 1,000 feet of existing sensitive receptors. The Project is anticipated to generate a maximum of 186 daily heavy-duty truck trips based on trip generation provided by Kimley-Horn (March 2025). An emission rate for $PM_{2.5}$ (DPM) was calculated using trip data and an EMission FACtor (EMFAC) model run for Alameda County; refer to Appendix A. EMFAC generates emission factors in terms of grams of pollutant emitted per vehicle activity and can calculate a matrix of emission factors at specific values of vehicle speed and type. The model was run for heavy-duty diesel vehicles traveling along off-site roads, adjacent to the Project site, and idling at the proposed loading area on-site. The analysis includes on-site idling and truck traffic on the following roadways and vehicle speeds:

- San Leandro Street (40 miles per hour)
- Hegenberger Road (40 miles per hour)
- On-Street Truck Movement (15 miles per hour)
- On-Street Idling (idle)

Idling emissions assumed 15 minutes of idling[19] for each truck. The emissions rates were calculated using 2029 (opening year) emissions factors; refer to Appendix A.

Off-Road Equipment. Operational off-road TAC emissions are typically generated by diesel off-road cargo handling equipment. However, based on information provided by the Applicant the Project would include 10 electric forklifts. Therefore, off-road equipment would not generate TACs and were not included in the analysis.

Emergency Fire Pump. The Project would include the installation of one emergency diesel fire pump.

[19] An idling time of 15 minutes per truck has been used per Bay Area Air District recommendations. Although the Project is required to comply with CARB's idling limit of 5 minutes, the Bay Area Air District recommends the on-site idling emissions should be estimated for 15 minutes of truck idling, which would take into account on-site idling that occurs while the trucks are waiting to pull up to the truck bays, idling at the bays, idling at check-in and check-out, etc.

The Project would include an emergency diesel fire pump that would operate during emergencies, testing and maintenance. Emissions from the fire pump would be infrequent and would not be constant. Further, the emergency fire pump operation must comply with the "Stationary Diesel Engine ATCM" section 93115 of the California Code of Regulations, which primarily limits non-emergency operation to a maximum of 50 hours per year for maintenance and testing purposes.

Dispersion Modeling

The air dispersion modeling for the construction and operational risk assessment was performed using the American Meteorological Society (AMS)/U.S. EPA Regulatory Model (AERMOD). AERMOD is a steady-state, multiple-source, Gaussian dispersion model designed for use with emission sources situated in terrain where ground elevations can exceed the stack heights of the emission sources (not a factor in this case). AERMOD estimates hourly concentrations for each source/receptor pair and calculates concentrations for user-specified averaging times, including an average concentration for the complete simulation period. AERMOD includes atmospheric dispersion options for both urban and rural environments and can address flat, gently rolling, and complex terrain situations. The modeling and analysis were prepared in accordance with the Bay Area Air District HRA guidelines and modeling guidance.[20] The parameters in AERMOD include the following:

- **Meteorological Data**. AERMOD requires hourly meteorological data consisting of wind vector, wind speed, temperature, stability class, and mixing height. The latest 5-year meteorological data set for the Oakland Airport Monitoring Station Monitoring Station (Station 23230) was obtained from the Bay Area Air District.[21] Surface and upper air meteorological data from this station was selected as being the most representative for meteorology based on proximity to the Project site, as well as terrain, surrounding land uses, and surface characteristics.
- **Project Sources**. Both construction and operational emission sources were modeled in AERMOD. The following discusses emission sources for construction and operations:
    - DPM Construction Sources. The emission sources in the model are line volume sources (comprised of smaller adjacent volume sources) for construction equipment and construction haul truck operations. Construction line volume sources were assigned a release height of 11.2 feet (3.40 meters). Construction line volume sources were assumed to operate eight hours per day.
    - TAC Construction Sources. The emission sources in the model are line volume sources (comprised of smaller adjacent volume sources) for construction equipment and construction haul truck operations during grading and excavation. Excavation activities and stockpiles associated with the infrastructure improvements on-site were modeled as area sources. Construction line volume and area sources were assumed to operate eight hours

[20] Bay Area Air Quality Management District, *Bay Area Air District Air Toxics NSR Program Health Risk Assessment (HRA) Guidelines*, December 2021 and *Bay Area Air District Health Risk Assessment Modeling Protocol*, December 2020.

[21] Bay Area Air Quality Management District, AERMOD-Ready Meteorological Data, https://www.baaqmd.gov/plans-and-climate/california-environmental-quality-act-ceqa/ceqa-tools/ceqa-modeling-data, accessed March 2025.

per day. The TAC construction sources used in AERMOD are summarized in Table 5: Dispersion Modeling Assumptions – Metals and Vapors.

Table 5: Dispersion Modeling Assumptions – Metals and Vapors

Emissions Source	Geometric Configuration[1]	Assumptions/Methodology/Model
Construction		
Grading	Line-Volume Sources	One line-volume source was included to calculate the dust released during the grading activities. A release height of 0 meters was modeled, with a plume width of 18 meters.
Sewer and Storm Drain Pipeline Excavation, Removal, and Replacement	Area Sources	The model includes 4 area polygons, each representing the existing and proposed sewer and strain drain pipelines. The release height modeled was 0 meters to account for release of materials at and below ground level.
Stockpiles	Area Sources	The model includes two area polygons, each representing the two anticipated stockpiles on-site. The release height of 0 meters was modeled to account for release of materials at ground level.

1. The emissions sources are defined as follows:
   - Line source: a series of volume sources (volume sources are a three-dimensional source of diffuse air pollutant emissions comprised of an area of emissions released at a height above ground) along a path (example: vehicular traffic along a roadway segment). Line sources (i.e., multiple volume sources) are also used to represent some construction activities.
   - Area Source: area sources are used to model releases that occur over an area. A polygon area used to model low level or ground level releases with no plume rise (example: storage piles, slag dumps, and lagoons).

    - Operational Sources. Operational line volume sources include the loading dock idling areas, on-site truck circulation, and off-site routes. This analysis conservatively assumes 100 percent of trucks would travel along San Leandro Street and Hegenberger Road, which are identified as truck routes within the City's General Plan. Operational line volume sources were assumed to operate 24 hours a day. Heavy-duty operational vehicle emissions were assigned a release height of 12 feet (3.70 meters), and a plume height of 20.6 feet (6.29 meters). A release height of 12 feet is the average stack height for trucks and the plume height is based on U.S. EPA guidance for vehicle volume sources. The emergency fire pump was modeled as a point source and was assigned a release height of six meters. The emergency fire pump was assumed to operate 50 hours annually for mandatory testing and maintenance. Building downwash[22] was applied for the emergency fire pump. It should be noted that the haul route closest to sensitive receptors would be located along San Leandro Street.

- **Averaging Times for DPM Sources**. AERMOD was run to obtain the period (i.e., annual) average $PM_{2.5}$ concentration in micrograms per cubic meter ($\mu g/m^3$) at the surrounding sensitive receptors as well as workers receptors. The period (annual) average concentrations were used to calculate the MICR and the maximum chronic hazard index (HI).

[22] Building downwash is applied to point sources in AERMOD to account for the potential for pollutants to be trapped in a recirculating pattern near buildings.

- **Averaging Times for TAC Sources**. For each modeled TAC source, a 1-hour, 8-hour, and period outputs were modeled in AERMOD with either PM_{10} as a proxy for the metals or "Other" as a proxy for VOCs. The period (annual) average concentrations were used to calculate the MICR, the 1-hour concentrations were used to calculate the acute risk, and the 8-hour concentrations were used to calculate the maximum chronic risk.
- **Receptor Grid**. To identify the maximum impacted sensitive receptors, a uniform Cartesian grid was placed over the sensitive receptors in the Project site's vicinity. A receptor grid was placed over the Project site to cover the zone of impact. Due to the size of the Project site, nearby sensitive receptors were modeled with a 35-meter grid spacing.
- **Terrain Characteristics**. AERMOD regulatory defaults, the "Urban" modeling option for the County, and "Elevated" terrain were used for this analysis. In addition, National Elevation Dataset (NED) terrain data was imported into AERMOD for the Project.

Risk and Hazard Assessment

Cancer Risk. Based on the OEHHA methodology, residential inhalation cancer risk from annual average DPM concentrations are calculated by multiplying the daily inhalation dose, cancer potency factor, age sensitivity factor (ASF), frequency of time spent at home, and exposure duration divided by averaging time, yielding the excess cancer risk. These factors are discussed in more detail below. It is important to note that exposure duration is based on continual heavy truck operation along nearby roadways. Exposure through inhalation (Dose-air) is a function of breathing rate, exposure frequency, and concentration of substance in the air. To estimate cancer risk, the dose was estimated by applying the following formula to each ground-level concentration:

$$\text{Dose-air} = C_{air} * (BR/BW) * A * EF * 10^{-6}$$

Dose-air =	dose through inhalation (mg/kg/day)
C_{air} =	air concentration ($\mu g/m^3$) from air dispersion model
(DBR/BW) =	daily breathing rate normalized to body weight (L/kg bodyweight-day)
A =	inhalation absorption factor (unitless)
EF =	exposure frequency (approximately 350 days per year for residential)
10^{-6} =	conversion factor (micrograms to milligrams, liters to cubic meters)

OEHHA developed ASFs to consider the increased sensitivity to carcinogens during early-life exposure. In the absence of chemical-specific data, OEHHA recommends default ASFs presented in Table 6: Exposure Assumptions. Fraction of time at home (FAH) during the day is used to adjust exposure duration and cancer risk from a specific facility's emissions, based on the assumption that exposure to the facility's emissions are not occurring away from home. OEHHA recommends the FAH values presented in Table 6: Exposure Assumptions. To calculate health impacts for comparison to Bay Area Air District thresholds, this report assesses risk to residential, worker, and sensitive receptors. The exposure rate for the residential scenario is more conservative than those for other sensitive receptor types (i.e. school child, daycare child, and patients) as residents have the highest exposure frequency, exposure time, and exposure duration, thus for this analysis, sensitive receptors were evaluated using residential exposure assumptions. The Bay Area Air District CEQA Air Quality Guidelines (April 2022) recognize that worker exposures should be evaluated where

they are reasonably foreseeable, particularly in cases of long-term employment near sources of air contaminants.

Table 6: Exposure Assumptions

Age	Exposure Frequency (days/year)	Exposure Duration (years)	Age Sensitivity Factor[1] (ASF)	Fraction of Time at Home (FAH)	Daily Breathing Rate (L/kg BW-day[2])
Residential					
Third trimester	350	0.25	10	100%	361
0 to 2 years	350	2	10	100%	1,090
Ages 2 through 8 years	350	7	3	100%	631
Ages 9 through 15 years	350	7	3	100%	572
Ages 16 and greater	350	14	1	73%	261
Worker[3]	250	25	1	N/A	230

1. Accounts for potential increased sensitivity to carcinogens during childhood.
2. Daily breathing rate normalized to body weight (L/kg body weight - day) (95th percentile for 3rd trimester to 2 years and 80th percentile for other age groups).
3. Worker and Student breathing rates are 95th percentile 8-hour breathing rates based on moderate intensity activity.

Source: California Office of Environmental Health Hazard Assessment, *Air Toxics Program Guidance Manual for the Preparation of Health Risk Assessments*, February 2015.
Bay Area Air Quality Management District, *Bay Area Air District Health Risk Assessment Modeling Protocol*, December 2020.

To estimate the cancer risk, the dose is multiplied by the cancer potency factor, the ASF, the exposure duration divided by averaging time, and the frequency of time spent at home (for residents only):

$$Risk_{inh\text{-}res} = (Dose_{air} * CPF * ASF * (ED/AT) * FAH)$$

$Risk_{inh\text{-}res}$ = residential inhalation cancer risk (potential chances per million)
$Dose_{air}$ = daily dose through inhalation (mg/kg-day)
CPF = inhalation cancer potency factor (mg/kg-day^{-1})
ASF = age sensitivity factor for a specified age group (unitless)
ED = exposure duration (years)
AT = averaging time of lifetime cancer risk (years)
FAH = fraction of time spent at home (unitless)

Acute and Chronic Non-Cancer Hazard. Non-cancer acute and chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. According to OEHHA, the chronic REL for DPM is 5 and the target organ is the respiratory system. The following equation was used to determine the non-cancer risk:

$$\text{Hazard Index} = C_i/REL_i$$

C_i = concentration in the air of substance i (annual average concentration in µg/m^3)
REL_i = acute / chronic noncancer Reference Exposure Level for substance (µg/m^3)

Health Risk Computation. A health risk computation was performed to determine the risk of developing an excess cancer risk calculated on a 30-year exposure scenario using the approach and the daily breathing rates, age sensitivity factors, exposure duration, and fraction of time at home described in the OEHHA *Air Toxics Program Guidance Manual for the Preparation of Health Risk*

Assessments (February 2015). Health risks were analyzed at the point of maximum impact and are a conservative estimate. The pollutant concentrations are then used to estimate the long-term cancer health risks to an individual as well as the non-cancer chronic health index.

The off-site impacts would occur from the on-site mechanical equipment and diesel trucks accessing the proposed Project, and fugitive dust containing TACs released during disturbance of impacted soils. The cancer and chronic health risks were evaluated based on the annual average concentration of $PM_{2.5}$ (used as a proxy for diesel particulate matter). The cancer and chronic health risks were evaluated based on the modeled concentrations of 1-hour, 8-hour, and period concentration of $PM_{2.5}$ (used as a proxy for metals) and "Other" (used as a proxy for VOCs and SVOCs).

As noted above, the acute, chronic, and carcinogenic health risk calculations are based on the standardized equations contained in the U.S. EPA *Human Health Evaluation Manual* (1991) and the OEHHA Guidance Manual (2015). The concentration estimate developed using this methodology is conservative and is not a specific prediction of the actual concentrations that would occur at or near the Project site at any one point in time. Receptors are often indoors and not in one location over the course of a lifetime exposure. Therefore, risk levels identified in this report represent a worst-case scenario. Actual pollutant concentrations and health risk levels are dependent on many variables, particularly the number and type of vehicles and equipment operating at specific distances during time periods of adverse meteorology. The health risk computation was performed to determine the risk of developing an excess cancer risk calculated on these worst-case exposure duration scenarios. Only the risk associated with the worst-case location of the Project was assessed (i.e., the maximally exposed individuals [MEI] identified in Section 5, below).

5.0 HEALTH RISK IMPACT EVALUATION

CARB identified DPM as a TAC in 1998 and as a result, OEHHA adopted a cancer risk factor for public exposure to DPM. Mobile sources (including trucks, buses, automobiles, trains, ships, and farm equipment) are by far the largest source of diesel emissions. Diesel exhaust is emitted from a broad range of on- and off-road diesel engines. In addition, soils at the Project site may contain TACs associated with historical foundry operations, including heavy metals, VOCs, and SVOCs. Disturbance of these soils during construction could result in the release of TACs in fugitive dust emissions. Because the Project is proposed near existing sensitive receptors (single-family residences), an analysis of both DPM from construction and operations and TAC emissions from impacted soils was performed using the U.S. EPA-approved AERMOD dispersion model.

5.1 Carcinogenic Risk

Construction-related activities would result in Project-generated emissions of DPM from the exhaust of off-road, heavy-duty diesel equipment for site preparation (e.g. demolition, clearing, grading); paving; application of architectural coatings; on-road truck travel; and other miscellaneous activities. For construction activity, DPM is the primary toxic air contaminant of concern. On-road diesel-powered haul trucks traveling to and from the construction area to deliver materials and equipment are less of a concern because they would not stay on the site for long durations. Diesel exhaust from construction equipment operating at the site could pose a health risk to nearby sensitive receptors.

In addition, disturbance of impacted soils at the Project site could release other TACs, including heavy metals, VOCs, and SVOCs, through fugitive dust emissions. While on-road diesel-powered haul trucks traveling to and from the construction area would also emit DPM, their contribution is less significant because of their limited on-site duration. Overall, diesel exhaust and fugitive dust emissions from impacted soils (including heavy metals, VOCs, and SVOCs) during construction have the potential to pose health risks to nearby sensitive receptors.

Long-term operations of the Project would generate ongoing diesel emissions from heavy-duty trucks traveling to and from the Project site for goods movement. These operational truck trips, which occur on a daily basis, represent a substantial long-term source of DPM emissions and may also contribute to localized health risks at sensitive receptors in proximity to the site.

Project construction would occur for a period of approximately 22 months. However, the health risk computation was performed to determine the risk of developing an excess cancer risk calculated on a 3-year exposure scenario, beginning with the third trimester, as recommended by the Bay Area Air District, and thus is conservative.[23] Further, based on OEHHA *Risk Assessment Guidelines*, the exposure duration for a resident is 30 years, beginning with the third trimester. Operations would commence following the construction period. The analysis calculates risk based on exposure to construction concentrations during the first 3 years of the exposure duration and operational concentrations for the remainder of the exposure duration (three year construction exposure duration followed by 27 year operational exposure duration). The reported annual pollutant

[23] The Bay Area Air District recommends that the cancer risk be evaluated assuming that the average daily dose for short-term exposure lasts a minimum of three years for projects lasting three years or less (Bay Area Air District, *Bay Area Air District Air Toxics NSR Program Health Risk Assessment Guidelines*, December 2021).

concentrations are at the closest maximally exposed individual (MEI). The maximally exposed individual resident (MEIR) is located 625 feet northeast of the Project site and maximally exposed individual worker (MEIW) is located 50 feet east of the Project site.

Table 7: DPM Particulate Matter Concentration and Carcinogenic Risk shows the health risk associated with DPM for the following scenarios: construction, operation, and combined construction and operation of the Project. As shown in Table 7, the construction risk associated with DPM emissions at residential and the off-site worker receptors would be approximately 0.09 and 0.07 in one million, respectively. Additionally, the operational cancer risk associated with DPM emissions at residential and the off-site worker receptors would be 0.13 and 0.15 in one million, respectively. The combined construction and operational cancer risk associated with DPM emissions at the residential and off-site worker receptors would be 0.19 and 0.22 in one million, respectively. Therefore, the maximum construction, operational cancer risk and combined construction and operational cancer risk associated with DPM emissions would not exceed the Bay Area Air District threshold of 10 in one million.

Additionally, the maximum $PM_{2.5}$ concentrations generated by DPM emissions during Project construction and operations and combined construction and operations would not exceed the Bay Area Air District threshold of 0.3 $\mu g/m^3$ at any of the receptors.

Table 7: DPM Particulate Matter Concentration and Carcinogenic Risk

Exposure Scenario[1]	$PM_{2.5}$ Annual Concentration ($\mu g/m^3$)	$PM_{2.5}$ Threshold ($\mu g/m^3$)	Cancer Risk (Risk per Million)[2]	Significance Threshold (Risk per Million)	Exceeds Risk Significance Threshold?
Construction					
Residential Receptor	0.02	0.30	0.09	10	No
Off-Site Worker Receptor	0.21	0.30	0.07	10	No
Operations					
Residential Receptor	<0.01	0.30	0.13	10	No
Off-Site Worker Receptor	0.01	0.30	0.15	10	No
Combined Construction + Operations					
Residential Receptor	0.03	0.30	0.19	10	No
Off-Site Worker Receptor	0.22	0.30	0.22	10	No

1. The reported annual pollutant concentration is at the closest maximally exposed individual (MEI) to the Project site. The maximally exposed individual resident (MEIR) is located 625 feet northeast of the Project site and maximally exposed individual worker (MEIW) is located 50 feet east of the Project site.
2. Exposure scenario is the risk from DPM.

Source: Refer to HRA Report Appendix A: Modeling Data.

Table 8: Multipollutant Carcinogenic Risk shows the health risk associated with COPC TAC emissions from impacted soils (including heavy metals, VOCs, and SVOCs) during construction. As shown in Table 8, the total construction risk associated with emissions from impacted soils at residential and the off-site worker receptors would be approximately 0.002 and 0.005 in one million, respectively. Therefore, the maximum construction cancer risk associated with emissions from impacted soils would not exceed the Bay Area Air District threshold of 10 in one million.

Non-Carcinogenic Hazard

The significance thresholds for TAC exposure also require an evaluation of non-cancer risk stated in terms of a hazard index. Non-cancer chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. RELs are designed to protect sensitive individuals within the population. For example, according to OEHHA, the REL for DPM is 5 and the target organ is the respiratory system.[24] The non-cancer risks for all other COPC were determined using the RELs shown in Table 1: COPCs and Health Risk Data above.

Chronic non-carcinogenic impacts associated with DPM from Project construction and operations are shown in Table 9: DPM Chronic Hazard Assessment. A chronic hazard index of 1.0 is considered individually significant. The hazard index is calculated by dividing the chronic exposure by the reference exposure level. The chronic hazard was calculated based on the highest annual average concentration at the MEI receptors. It should be noted that there is no acute REL for DPM and acute health risk cannot be calculated.

Table 9: DPM Chronic Hazard Assessment

Chronic, acute, and 8-hour non-carcinogenic impacts associated with COPC TAC emissions from impacted soils (including heavy metals, VOCs, and SVOCs) from Project construction are shown in Table 10: Multipollutant Chronic and Acute Hazard Assessment. A chronic, acute, and 8-hour hazard index of 1.0 is considered individually significant. The hazard index is calculated by dividing the chronic exposure by the reference exposure level. The chronic hazard was calculated based on the highest annual average concentration at the MEI receptors.

Table 10: Multipollutant Chronic and Acute Hazard Assessment				
Pollutant Type	**Exposure Scenario[1,2]**	**Chronic Hazard**	**Acute Hazard**	**8-hour**
Construction				
Metals	Residential Receptor	<0.001	0.001	0.010
	Off Site Worker Receptor	0.023	0.003	0.151
VOCs	Residential Receptor	<0.001	0.008	0.001
	Off Site Worker Receptor	<0.001	0.074	0.008
SVOCs	Residential Receptor	<0.001	<0.001	<0.001
	Off Site Worker Receptor	<0.001	<0.001	<0.001
Total Multipollutant	**Residential Receptor**	**<0.001**	**0.009**	**0.011**
	Off Site Worker Receptor	**0.023**	**0.077**	**0.159**
Bay Area Air District Threshold		*1.0*	*1.0*	*1.0*
Threshold Exceeded?		No	No	No
1. The maximally exposed individual resident (MEIR) is located 625 feet northeast of the Project site and maximally exposed individual worker (MEIW) is located 50 feet east of the Project site. 2. Exposure scenario is the risk from COPCs (including heavy metals, VOCs, and SVOCs).				
Source: Refer to Appendix A.				

The highest maximum chronic hazard index associated with both DPM and COPC TAC emissions from Project construction would be less than 0.001 at the residential receptor and 0.023 at the off-site worker receptor. Additionally, the highest maximum chronic hazard index associated with DPM emissions from Project operations would be less than 0.001 at the residential receptor as well as the off-site worker receptor. The highest acute hazard index associated with Project construction would be 0.009 at the residential receptor and 0.077 at the off-site worker receptor. The highest maximum 8-hour hazard index associated with Project construction would be 0.011 at the residential receptor and 0.159 at the off-site worker receptor. Therefore, construction and operational non-carcinogenic

hazards associated with both DPM and COPC TAC emissions would not exceed the acceptable limits of 1.0 and impacts would be less than significant.

5.2 Cumulative Health Impacts

Cumulative impacts are defined as two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts. CEQA Guidelines 15065(a)(3) states "… 'Cumulatively considerable' means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects."

The Bay Area Air District recommends that the cumulative analysis combine the risks and hazards from existing sources within 1,000 feet of the project's sources with the risks and hazards from the project's sources. Therefore, mobile and stationary sources[25] within a 1,000-foot radius of the Project site were reviewed using Bay Area Air District's Stationary Source Screening Analysis Tools per Bay Area Air District CEQA Guidelines. Six stationary sources is located within a 1,000-foot radius of the Project site. As shown in Table 11: Cumulative Operational Health Risk, cumulative impacts related to cancer risk and hazard would be less than significant and within acceptable limits. Additionally, the maximum cumulative $PM_{2.5}$ concentrations would not exceed Bay Area Air District's cumulative threshold of 0.8 µg/m^3, the primary contributor to those concentrations is the existing stationary sources near the Project area. The existing highway sources have a high $PM_{2.5}$ concentration (0.22 µg/m^3). The existing stationary sources represent approximately 60 percent of the total concentrations and are unrelated to the Project. The Project represents less than three percent of total cumulative $PM_{2.5}$ in the Project area.

The Project and the cumulative project total $PM_{2.5}$ concentrations and cancer risk would not exceed Bay Area Air District cumulative thresholds. Therefore, the combined effects from both the proposed Project and related projects would not be cumulatively significant. The Project is also below Bay Area Air District's incremental health risk thresholds. Therefore, the incremental effect of the individual Project is also less than cumulatively considerable.[26] As the related cumulative TAC sources in the Project area do not exceed Bay Area Air District cumulative thresholds for cancer risk and the Project does not exceed Bay Area Air District incremental thresholds, impacts would not be cumulatively considerable. Therefore, the project's cumulative impacts would be less than cumulatively considerable.

[25] Stationary sources are defined as sources that remain in a single location while they are operating.

[26] CEQA case law has held that any additional emissions in an impacted area does not necessarily create a significant cumulative impact, finding that "the 'one [additional] molecule rule' is not the law" (Communities for a Better Environment v. California Resources Agency (2002) 103 Cal. App. 4th 98, 120).

Table 11: Cumulative Operational Health Risk			
Emissions Sources	**$PM_{2.5}$ (µg/m^3)**	**Cancer Risk (per million)**	**Hazard**
Project Emissions (Combined Construction + Operations)	0.03	0.19	0.12

5.3 Conclusion

As described above, impacts related to incremental excess cancer risk would be less than significant. Additionally, non-carcinogenic hazards are calculated to be within acceptable limits. Project and related project total $PM_{2.5}$ concentrations, cancer risk, chronic hazard, and acute hazard would not exceed Bay Area Air District cumulative thresholds. The Project's would not make a cumulatively considerable contribution to significant cumulative health risk.

Mitigation Measure(s): No mitigation is required.

Level of Significance: Less than significant impact.

Season: Annual
Vehicle Classification: EMFAC2007 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.

		PM10	PM2.5	PM10	PM2.5
		g/mi	g/mi	lb/mi	lb/mi

Table 1
CONSOLIDATED TABLE OF OEHHA/ARB APPROVED RISK ASSESSMENT HEALTH VALUES[a]

Purpose:	The purpose of this reference table is to provide a quick list of all health values that have been approved by the Office of Environmental Health Hazard Assessment (OEHHA) and the Air Resources Board (ARB) for use in facility health risk assessments conducted for the AB 2588 Air Toxics "Hot Spots" Program. The OEHHA has developed and adopted new risk assessment guidelines that update and replace the California Air Pollution Control Officers Association's (CAPCOA) *Air Toxics "Hot Spots" Program Revised 1992 Risk Assessment Guidelines, October 1993.* The OEHHA has adopted three technical support documents for these guidelines, which can be found on their website (http://www.oehha.ca.gov/air/hot_spots/index.html). This table lists the OEHHA adopted inhalation and oral cancer slope factors, noncancer acute Reference Exposure Levels (RELs), and inhalation and oral noncancer chronic RELs. OEHHA is still in the process of adopting new health values. Therefore, new health values will periodically be added to, or deleted from, this table. Users of this table are advised to monitor the OEHHA website (*www.oehha.ca.gov*) for any updates to the health values. May 2008 update: The Air Resources Board adopted amendments to the AB 2588 Air Toxics "Hot Spots" Emission Inventory Criteria and Guidelines Regulation (Title 17, California Code of Regulations, Section 93300.5) on November 16, 2006. The amendments became effective on September 26, 2007, after approval from the Office of Administrative Law. Under the new amendments, the substances previously listed in Appendix A-I *(Substances for Which Emissions Must Be Quantified*) and Appendix F (*Criteria For Inputs For Risk Assessment Using Screening Air Dispersion Modeling*) of the ARB's *Air Toxics "Hot Spots" Emission Inventory Criteria and Guidelines (EICG) (July 1997)* have been removed from this table. September 2022 update: The Air Resources Board adopted amendments to the AB 2588 Air Toxics "Hot Spots" Emission Inventory Criteria and Guidelines Regulation (Title 17, California Code of Regulations, Section 93300.5) on November 19, 2020. The amendments became effective on March 21, 2022, after approval from the Office of Administrative Law. Under the new amendments a number of pollutants were added to Appendix A-1: *Substances for Which Emissions Must be Quantified.* OEHHA was consulted to determine which existing health values may be applied to these new pollutants. OEHHA applied health values to 61 pollutants. OEHHA also helped determine the appropriate MWAF, if applicable. NOTE ON REPORTING UNDER HOT SPOTS PROGRAM: New chemicals that are reported by a facility due to being covered by one of the chemical "functional group" definitions, which are shown at the end of EICG Appendix A-I (i.e., the functional groups related to isocyanates, halogenated PAHs, and certain types of per/poly fluorinated compounds), should be discussed with CARB and/or OEHHA to determine whether an OEHHA health value may apply to them.
a	The *italic* font used in this table is designed to clarify applicability of OEHHA adopted health effects values to individual or grouped substances listed in the *Air Toxics "Hot Spots" Emission Inventory Criteria and Guidelines*, Appendix A-I list of *"Substances for Which Emissions Must Be Quantified"*.
b	Chemical Abstract Service Number (CAS): For chemical groupings and mixtures where a CAS number is not applicable, the 4-digit code used in the *Air Toxics "Hot Spots" Emission Inventory Criteria and Guidelines (EICG) Report* is listed. The 4-digit codes enclosed in brackets [ ] are codes that have been phased out, but may still appear on previously reported Hot Spots emissions. For information on the origin and use of the 4-digit code, see the EICG report. (https://ww2.arb.ca.gov/our-work/programs/ab-2588-air-toxics-hot-spots/hot-spots-inventory-guidelines)

Table 1
CONSOLIDATED TABLE OF OEHHA/ARB APPROVED RISK ASSESSMENT HEALTH VALUES[a]

c Date Value Reviewed [Added]: These columns list the date that the health value was last reviewed by OEHHA, and/or the Scientific Review Panel, and/or approved for use in the AB 2588 Air Toxics "Hot Spots" Program

- If the health value is unchanged since it was first approved for use in the Hot Spots Program, then the date that the value was first approved for use by CAPCOA is listed within the brackets [ ].
- April 1999 is listed for the cancer potency values and noncancer acute RELs, which have been adopted by the OEHHA as part of the AB 2588 Hot Spot Risk Assessment Guidelines.
- February 2000, April 2000, January 2001, and December 2001 are listed for the first set of 22, the second set of 16, the third set of 22, and the fourth set of 12 noncancer chronic RELs, respectively. The chronic REL for carbon disulfide was adopted in May 2002. Chronic RELs for phosphine and triethylamine were adopted in September 2002. Chronic RELs for fluorides including hydrogen fluoride were adopted August 2003. Chronic REL for silica [crystalline respirable] was adopted February 2005.
- October 2000 is listed for the oral chronic RELs and oral cancer slope factors.
- Cancer potency value adopted for naphthalene in August 2004. The inhalation and oral cancer potency values for ethyl benzene were adopted in November 2007.
- For the substances identified as Toxic Air Contaminants, the Air Resources Board hearing date is listed. The dates for acetaldehyde, benzo[a]pyrene, and methyl tertiary-butyl ether represent the dates the values were approved by the Scientific Review Panel.
- On December 19, 2008, OEHHA adopted new acute, 8-hour, and chronic RELs for acetaldehyde, acrolein, arsenic, formaldehyde, manganese, and mercury. The most current health values can be found at: http://www.oehha.ca.gov/air/allrels.html.

  Note: 1. We present the new oral RELs only in milligrams per kilogram-day (mg/kg-d), although OEHHA has presented them in other tables in either micrograms per kilogram-day (μg/kg-d) or milligrams per kilogram-day.

  2. All acute RELs use a 1-hour averaging period (OEHHA, 2008). RELs which were developed using earlier guidelines and specified a different averaging time are unchanged in concentration value, but now refer to the 1-hour averaging period. As of August 1, 2013, the affected chemicals are: benzene, carbon disulfide, carbon tetrachloride, chloroform, ethylene glycol monoethyl ether, ethylene glycol monoethyl ether acetate, and ethylene glycol monomethyl ether: These may be replaced by updated RELs following the OEHHA (2008) guidelines in due course.

  3. At OEHHA's direction, the chronic oral REL for arsenic does not apply to arsine because arsine is a gas and not particle associated.
- OEHHA's adoption of the World Health Organization's 2005 Toxicity Equivalency Factors for polychlorinated dibenzo-p-dioxins (PCDDs), dibenzofurans (PCDFs), and dioxin-like polychlorinated biphenyls (PCBs) occurred in January 2011. See Appendix C of OEHHA's *Air Toxics Hot Spots Program Technical Support Document for Cancer Potencies* at https://oehha.ca.gov/air/crnr/technical-support-document-cancer-potency-factors-2009 for more information.
- On March 23, 2012, OEHHA adopted revised acute, 8-hour and chronic RELs for nickel and nickel compounds. The values of the RELs are listed in the table at: http://www.oehha.ca.gov/air/chronic_rels/032312CREL.html.
- On July 29, 2013, OEHHA adopted an acute and 8-hour REL, and a revised chronic REL for 1,3-butadiene. The REL values and summary can be found online at: http://www.oehha.ca.gov/air/hot_spots/index.html.
- On October 18, 2013, the following changes were made to the Consolidated Table of OEHHA/ARB Approved Risk Assessment Health Values:
  - OEHHA adopted acute, 8-hour, and chronic RELs for caprolactam. The REL values and summary can be found at: https://oehha.ca.gov/media/downloads/crnr/caprolactam2013.pdf.
  - Changes have been made to target organs to the following substances with no change to health factors: Chloroform, Diethanolamine, Fluorides and Hydrogen Fluoride, Methylene Chloride, Styrene, Xylenes. The "date added" in this table reflects the date of the health factor only.
- On June 27, 2014, OEHHA adopted a new 8-hour REL and revised acute and chronic RELs for benzene. The REL values and summary can be found at: http://www.oehha.ca.gov/air/chronic_rels/BenzeneJune2014.html.
- On March 28, 2016, OEHHA adopted new and revised RELs for toluene diisocyanate (TDI) and methylene diphenyl diisocyanate (MDI). The REL values and summaries can be found at: http://www.oehha.ca.gov/air/chronic_rels/032816TDI_MDI_RELs.html. On March 30, 2016, the name of MDI was changed from methylene diphenyl isocyanate to a more accurate name: methylene diphenyl diisocyanate.
- On September 8, 2016, OEHHA adopted an updated inhalation cancer unit risk factor (URF) for perchloroethylene (PCE or tetrachloroethylene). The updated URF and summary can be found at: http://oehha.ca.gov/air/crnr/notice-adoption-inhalation-cancer-unit-risk-factor-perchloroethylene.

Table 1
CONSOLIDATED TABLE OF OEHHA/ARB APPROVED RISK ASSESSMENT HEALTH VALUES[a]

	• On February 21, 2017, OEHHA adopted new acute, 8-hour, and chronic inhalation RELs for carbonyl sulfide. The REL values and summary can be found at: http://oehha.ca.gov/air/crnr/notice-adoption-reference-exposure-levels-carbonyl-sulfide. • On May 4, 2018, OEHHA adopted new 8-hour and chronic inhalation REL, and a revised acute REL for ethylene glycol butyl ether. The REL values and summary can be found at: https://oehha.ca.gov/air/chemicals/ethylene-glycol-monobutyl-ether. • On August 16, 2018, OEHHA adopted an inhalation URF, inhalation cancer potency factor, and oral cancer potency factor for tertiary-butyl acetate (TBAc). Although OEHHA has adopted an oral cancer potency value for tertiary-butyl acetate, its chemical/biological properties do not fit the multipathway scheme. Therefore, non-inhalation pathway risks calculated from this value will be zero because the transfer factors are set to zero. Please contact OEHHA for more information. The values can be found at: https://oehha.ca.gov/air/crnr/notice-adoption-cancer-inhalation-unit-risk-and-slope-factors-and-cancer-oral-slope-factor • On September 6, 2019, OEHHA adopted new RELs for hexamethylene diisocyanate. The REL values and summary can be found at: https://oehha.ca.gov/air/crnr/notice-adoption-reference-exposure-levels-hexamethylene-diisocyanate. • On August 20, 2020, OEHHA adopted new and revised RELs for toluene. The REL values and summary can be found at: https://oehha.ca.gov/air/crnr/notice-adoption-reference-exposure-levels-toluene. • On October 2, 2020, OEHHA adopted a new inhalation URF for cobalt. The updated URF and summary can be found at: https://oehha.ca.gov/air/crnr/notice-adoption-cancer-inhalation-unit-risk-factors-cobalt-and-cobalt-compounds • On August 31, 2022, OEHHA adopted new RELs for trivalent chromium (CrIII). The REL values and summary can be found at: https://oehha.ca.gov/air/document/chromium-trivalent-inorganic-water-soluble-compounds-reference-exposure-levels-rels. • August 2022 [8/22] is listed to reflect the new pollutants that were added to Appendix A-1: Substances for Which Emissions Must be Quantified in the 2022 Emission Inventory Criteria Guidelines (https://ww2.arb.ca.gov/our-work/programs/ab-2588-air-toxics-hot-spots/hot-spots-inventory-guidelines). OEHHA was consulted to determine which existing health values may be applied to these new pollutants. Health values were added for 61 pollutants on August 31, 2022. OEHHA was also consulted on the appropriate MWAF, if applicable. • Selenium hexafluoride (7783-79-1): The health values for fluorides were applied to selenium hexafluoride. Selenium also has a set of health values; however, the Hot Spots Analysis and Reporting Program (HARP) software can only apply one set of health values for each pollutant. To account for the additional toxicity of selenium, the MWAF default is 1. • On December 9, 2022, OEHHA adopted a new inhalation cancer unit risk factor (URF) for 1-bromopropane. The URF and summary can be found at: https://oehha.ca.gov/air/crnr/notice-adoption-cancer-inhalation-unit-risk-and-slope-factors-1-bromopropane. • On April 28, 2023, OEHHA adopted new RELs for 1-bromopropane. The REL values and summary can be found at: https://oehha.ca.gov/air/crnr/notice-adoption-reference-exposure-levels-1-bromopropane. • On August 4, 2023, OEHHA adopted a revised cancer URF for cobalt sulfate heptahydrate and water-soluble cobalt compounds. The updated URF and summary can be found at: https://oehha.ca.gov/air/crnr/notice-adoption-revised-cancer-inhalation-unit-risk-factors-cobalt-sulfate-heptahydrate-and • On October 6, 2023, OEHHA adopted new RELs for trimethylbenzenes. The REL values and summary can be found at: https://oehha.ca.gov/air/crnr/notice-adoption-reference-exposure-levels-trimethylbenzenes
d	Inhalation cancer potency factor: The "unit risk factor" has been replaced in the new risk assessment algorithms by a factor called the "inhalation cancer potency factor". Inhalation cancer potency factors are expressed as units of inverse dose [i.e., $(mg/kg\text{-}day)^{-1}$]. They were derived from unit risk factors [units = $(ug/m^3)^{-1}$] by assuming that a receptor weighs 70 kilograms and breathes 20 cubic meters of air per day. The inhalation potency factor is used to calculate a potential inhalation cancer risk using the new risk assessment algorithms defined in the OEHHA, *Air Toxics Hot Spots Program; Technical Support Document for Exposure Assessment and Stochastic Analysis (August 2012)*. (https://oehha.ca.gov/media/downloads/crnr/exposureassessment2012tsd.pdf)
e	Molecular Weight Adjustment Factor: For most of the Hot Spots toxic metals, the OEHHA cancer potency factors and noncancer RELs apply to the weight of the toxic metal atom contained in the overall compound. Some of the Hot Spots compounds contain various elements along with the toxic metal atom (e.g., "Nickel hydroxide", CAS number 12054-48-7, has a formula of H2NiO2). Therefore, an adjustment to the reported pounds of the overall compound is needed before applying the OEHHA cancer potency factor and noncancer RELs for "Nickel and compounds" to such a compound. This ensures that the cancer potency factor and noncancer RELs are applied only to the fraction of the overall weight of the emissions that are associated with health effects of the metal. In other cases, the Hot Spots metals are already reported as the metal atom equivalent (e.g., CAS 7440-02-0, "Nickel"), and these cases do not use any further molecular weight adjustment. (Refer to Note [7] in Appendix A, List of Substances in the EICG Report for further information on how the emissions of various Hot Spots metal compounds are reported.) The appropriate molecular weight adjustment factors (MWAF) to be used along with the OEHHA cancer potency factors and noncancer RELs for Hot Spots metals can be found in the MWAF column of this table. So, for example, assume that 100 pounds of "Nickel hydroxide" emissions are reported under CAS number 12054-48-7. To get the Nickel atom equivalent of these emissions, multiply by the listed MWAF (0.6332) for Nickel hydroxide: • 100 pounds x 0.6332 = 63.32 pounds of Nickel atom equivalent. This step should be completed prior to applying the OEHHA cancer potency factor and noncancer RELs for "Nickel and compounds" in a calculation for a prioritization score or risk assessment calculation. (Note -The HARP software automatically applies the appropriate MWAF for each Hot Spots chemical (by CAS number), so the emissions should not be manually adjusted when using HARP. Therefore, if using HARP, you would use 100 pounds for Nickel hydroxide and HARP will make the MWAF adjustment for you. If not using HARP, you would use 63.32 pounds.) For more information on MWAF please refer to Section 4.2.1.1.1 of OEHHA's document *The Air Toxics Hot Spots Program Guidance Manual for the Preparation of Risk Assessments* (Guidance Manual) (February 2015). Note: The value listed in the MWAF column for Asbestos is not a molecular weight adjustment. This is a conversion factor for adjusting mass and fibers or structures. See Appendix C of OEHHA's Guidance Manual (February 2015) for more information on Asbestos reporting and risk assessment information or see the EICG report for reporting guidance. Also see the Asbestos footnote (designated by the letter f).
TAC	Toxic Air Contaminant: The Air Resources Board has identified this substance as a Toxic Air Contaminant. (https://ww2.arb.ca.gov/resources/documents/carb-identified-toxic-air-contaminants)

Table 1
CONSOLIDATED TABLE OF OEHHA/ARB APPROVED RISK ASSESSMENT HEALTH VALUES[a]

f	Asbestos: The units for the Inhalation Cancer Potency factor for asbestos are (100 PCM fibers/m^3)$^{-1}$. A conversion factor of 100 fibers/0.003 µg can be multiplied by a receptor concentration of asbestos expressed in µg/m^3. Unless other information necessary to estimate the concentration (fibers/m^3) of asbestos at receptors of interest is available. A unit risk factor of 1.9 E 10^{-4} (µg/m^3)$^{-1}$ and an inhalation cancer potency factor of 2.2 E 10^{+2} (mg/kg BW * day)$^{-1}$ are available. For more information on asbestos quantity conversion factors, see Appendix F of OEHHA's *The Air Toxics Hot Spots Program Risk Assessment Guidelines; Part II; Technical Support Document for Cancer Potency Factors (May 2009)* (*https://oehha.ca.gov/air/crnr/technical-support-document-cancer-potency-factors-2009*), and Appendix C of OEHHA's Guidance Manual (February 2015) (https://oehha.ca.gov/air/cmr/notice-adoption-air-toxics-hot-spots-program-guidance-manual-preparation-health-risk-0).
g	Chromium 6 (Hexavalent Chromium): In July 2011, OEHHA developed the oral cancer slope factor for chromium 6+ and compounds for the California Public Health Goal in drinking water. As of February 2014, OEHHA states it should also be used for the Hot Spots program.
h	Lead, Inorganic: Inorganic Lead was identified by the Air Resources Board as a Toxic Air Contaminant in April 1997. Since information on noncancer health effects show no identified threshold, no Reference Exposure Level has been developed. The document, *Risk Management Guidelines for New, Modified, and Existing Sources of Lead, March 2001*, has been developed by ARB and OEHHA staff for assessing noncancer health impacts from sources of lead (https://ww2.arb.ca.gov/sites/default/files/classic/toxics/lead/mainandappend.pdf?_ga=2.97130777.765928880.1615842085-992278915.1615253163). See Appendix F of OEHHA's document *The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (2003)* for an overview of how to evaluate noncancer impacts from exposure to lead using these risk management guidelines (https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf).
i	Particulate Emissions from Diesel-Fueled Engines: The inhalation cancer potency factor was derived from whole diesel exhaust and should be used only for impacts from the inhalation pathway (based on diesel PM measurements). The inhalation impacts from speciated emissions from diesel-fueled engines are already accounted for in the inhalation cancer potency factor. However, at the discretion of the risk assessor, speciated emissions from diesel-fueled engines may be used to estimate acute noncancer health impacts or the contribution to cancer risk or chronic noncancer health impacts for the non-inhalation exposure pathway. See Appendix D of OEHHA's document *The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments* (2003) for more information. The noncancer chronic REL for diesel exhaust is based on assumptions of contributions of diesel PM to ambient PM. It should be used with diesel PM measurement.
j	Cancer Potency Factors (CPFs) for unspeciated mixtures of Polychlorinated Biphenyls: High Risk: For use in cases where congeners with more than four chlorines comprise more than one-half percent of total polychlorinated biphenyls. Use as default CPF for Tier 1 assessments. Low Risk: This number would not ordinarily be used in the Hot Spots program. Lowest Risk: For use in cases where congeners with more than four chlorines comprise less than one-half percent of total polychlorinated biphenyls. As of February 2014, there is no approved method that can be used to assess the noncancer hazard of an unspeciated PCB mixture. Persons preparing HRAs for the Hot Spots Program should consult with OEHHA and the local Air Pollution Control or Air Quality Management District if an assessment of the noncancer hazard for unspeciated PCB mixtures is needed.
k	Polychlorinated Dibenzo-p-dioxins and Polychlorinated Dibenzofurans (also referred to as chlorinated dioxins and dibenzofurans) and dioxin-like PCB congeners: The OEHHA has adopted the World Health Organization 2005 (WHO-05) Toxicity Equivalency Factor scheme for evaluating the risk due to exposure to samples containing mixtures of polychlorinated dibenzo-p-dioxins (PCDD) and polychlorinated dibenzofurans (PCDF) and a number of dioxin-like PCB congeners. See Appendix A of OEHHA's *Technical Support Document for Describing Available Cancer Potency Factors* for more information about the scheme. See Appendix C (revised January 20, 2011) of OEHHA's Technical Support Document: Methodologies for Derivation, Listing of Available Values, and Adjustments to Allow for Early Life Exposures (2009) online at http://oehha.ca.gov/air/hot_spots/tsd052909.html for more information about the scheme. The two numbers (i.e., 1085 and 1086) in the column listing Chemical Abstracts Numbers are used for reporting and risk assessment purposes. Be sure to input emissions under the proper code when using the HARP software. ID code 1085 has no health values associated with it in the HARP software; therefore, no health impacts will be calculated when using ID 1085. See the Emissions Inventory Criteria and Guidelines for more information on reporting emissions.
l	Polycyclic Aromatic Hydrocarbons (PAHs): These substances are PAH or PAH-derivatives that have OEHHA-developed Potency Equivalency Factors (PEFs) which were approved by the Scientific Review Panel in April 1994 (see ARB document entitled *Benzo[a]pyrene as a Toxic Air Contaminant*). PAH inhalation slope factors listed here have been adjusted by the PEFs. See OEHHA's Technical Support Document: Methodologies for Derivation, Listing of Available Values, and Adjustments to Allow for Early Life Exposures (2009) for more information about the scheme. Section 8.2.3 and Appendix G of OEHHA's *The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (2003)* also contains information on PAHs. The two numbers (i.e., 1150 and 1151) in the column listing Chemical Abstracts Numbers are used for reporting and risk assessment purposes. Be sure to input emissions under the proper code when using the HARP software. ID code 1150 has no health values associated with it in the HARP software; therefore, no health impacts will be calculated when using ID 1150. See the Emissions Inventory Criteria and Guidelines for more information on reporting emissions.
m	SELENIUM AND COMPOUNDS: In February 2014, an oral REL was added to the consolidated table. The REL was adopted in December 2001 but could not be used by the Hot Spots Program (or HARP software) until transfer factors for the oral and dermal routes were adopted. Transfer factors were included in the OEHHA's *Technical Support Document for Exposure Assessment and Stochastic Analysis* (August 2012) and were added to the HARP software in March 2015.
n	1,6-HEXAMETHYLENE DIISOCYANATE (HDI): On September 19, 2019, acute, 8-hour, and chronic RELs were added to the table and HARP for the HDI (monomer). OEHHA adopted these RELs and others for HDI polyisocyanates on September 6, 2019. The Acute, 8-hour, and chronic RELs for HDI polyisocyanates were added to the consolidated table and HARP on August 31, 2022.

Table 1
CONSOLIDATED TABLE OF OEHHA/ARB APPROVED RISK ASSESSMENT HEALTH VALUES[a]

N/A Not Applicable.

Other Changes:

- 10/18/2010, removed CHLORODIFLUOROMETHANE, which should have been removed in May 2008.

February 2014:

- Removed applicability of oleum to the sulfuric acid chronic inhalation REL because oleum represents only an acute health hazard.
- Removed "METHYL MERCURY (see Mercury & Compounds)" entry because methyl mercury has different chemical properties, potency, and toxicity compared to elemental mercury and mercury salts, and it is not emitted directly from any California facilities.
- September 1, 2017, changed the "1101 Fluorides" entry back to "1101 Fluorides and compounds" to keep the consistency with the Emission Inventory Guidelines. The substance name for CAS# 1101 was changed from "Fluorides and compounds" as in 2002 to "Fluorides" in 2003 without footnotes about the change.
