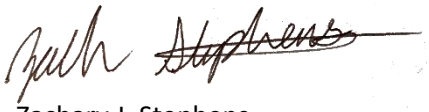
Attention: Mr. Jason Bernstein

Subject: ASTM Phase I Environmental Site Assessment
AB&I Foundry
7741, 7825, and 7929 San Leandro Street
Oakland, California

Ladies and Gentlemen:



The enclosed report presents the results of a Phase I Environmental Site Assessment (Phase I, or Phase I ESA) conducted at the American Brass and Iron (AB&I) Foundry property, located at 7741, 7825, and 7929 San Leandro Street in Oakland, California (herein referred to as the "Subject Property"). This work was performed by Haley & Aldrich, Inc. (Haley & Aldrich), in accordance with the Duke Realty Corporation Professional Services Agreement dated 9 February 2022. This Phase I ESA was conducted in conformance with the scope and limitations of the American Society for Testing and Materials (ASTM) E 1527-13, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process as referenced in 40 Code of Federal Regulations (CFR) Part 312 (the All Appropriate Inquiries [AAI] Rule).

The objective of a Phase I is to assess whether "recognized environmental conditions" (REC), historical RECs (HREC), or controlled RECs (CREC) are associated with the Subject Property, as defined in the ASTM E 1527-13 Standard.

This assessment has revealed three RECs, one CREC, and one HREC in connection with the Subject Property.

Thank you for the opportunity to perform these services for you. Please do not hesitate to contact us if you have any questions or comments.

Sincerely yours,
HALEY & ALDRICH, INC.

Enclosures

Executive Summary

Haley & Aldrich, Inc. (Haley & Aldrich) has performed a Phase I Environmental Site Assessment (Phase I) of the American Brass and Iron (AB&I) Foundry Property located at 7741, 7825, and 7929 San Leandro Street in Oakland California, (herein referred to as the "Subject Property"; Figure 1). The scope of work is described and conditioned by our proposal dated 4 February 2022. This Phase I was performed for Duke Realty Corporation (Duke) who seeks to purchase and redevelop the Subject Property. This Phase I was performed in conformance with the scope and limitations of the ASTM E 1527-13 Standard and All Appropriate Inquiries (AAI) Rule.[1]

SUBJECT PROPERTY DESCRIPTION

The Subject Property consists of 15 parcels totaling approximately 14.5 acres and is developed with a two-story office building, multiple warehouses, a foundry and manufacturing building, material storage areas, and a parking lot (Figures 2 and 3). The majority of the Subject Property is owned by McWane, Inc., with four of the 15 parcels on the northwest and southeast sides owned by Enrique and Edevelia Barraza, or Bosley Investments LTD, and leased to McWane, Inc. The Subject Property is currently occupied by AB&I, a gray iron foundry which produces cast iron for the manufacture of pipe and pipe fittings. The Subject Property has operated as an iron foundry since 1940.

OBJECTIVE

The objective of a Phase I is to assess whether "recognized environmental conditions" (REC), historical RECs (HREC), and controlled RECs (CREC) are associated with the Subject Property. Our conclusions are intended to help the user evaluate the "business environmental risk" associated with the Subject Property. Our opinion regarding a REC's potential impact on the Subject Property is based on the scope of our work, the information obtained during the course of our work, the conditions prevailing at the time our work was performed, the applicable regulatory requirements in effect at the time our work was performed, our experience evaluating similar sites, and on our understanding of the client's intention to purchase and redevelop the Subject Property with a warehouse and parking lot.

RECOGNIZED ENVIRONMENTAL CONDITIONS

The ASTM E 1527-13 Standard defines a REC in part as "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment."

The following RECs were identified in connection with the Subject Property.

[1] American Society for Testing and Materials (ASTM) E 1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process as referenced in 40 Code of Federal Regulations (CFR) Part 312 (the All Appropriate Inquiries [AAI] Rule) ("ASTM E 1527-13 Standard"). Specified terms as are used in ASTM E 1527-13 are highlighted in blue in this report and defined in the Glossary at the end of the report text.

REC #1: Soil Vapor and Groundwater Concentrations Exceed ESLs

The results of environmental sampling performed in 2008 through 2010 showed concentrations of petroleum hydrocarbons and volatile organic compounds (VOCs) in soil vapor and groundwater at concentrations above the Environmental Screening Levels (ESLs) established by the San Francisco Bay Regional Water Quality Control Board (RWQCB), dated July 2019 (Rev 2), to assess for potential vapor intrusion risk at commercial/industrial properties.

REC #2: Stormwater permit parameter exceedances of magnesium and aluminum

In 2017 and 2018, stormwater samples taken at the Subject Property exceeded Level 2 Numeric Action Levels (NAL) for magnesium. Results of sampling in 2020 show aluminum in stormwater at levels exceeding the NAL for aluminum. The Subject Property is required to demonstrate best management practices (BMP) and sample for magnesium and aluminum through the 2021-2022 monitoring cycle.

REC #3: Industrial use of the Subject Property as a foundry since 1940

The Subject Property has been an active foundry since 1940, which pre-dates most current environmental statutes. While previous investigations focused on areas of former underground storage tanks (USTs), a comprehensive subsurface investigation has not been conducted throughout the Subject Property. For example, soil samples collected from stockpiles generated from excavations performed in locations around the Subject Property between 2019 and 2021 contained lead at concentrations above ESLs as well as the threshold for classification as a California hazardous waste with no source(s) for the elevated lead concentrations identified. Considering this information, the 80 years of industrial operations at the Subject Property poses a potential environmental risk.

CONTROLLED RECOGNIZED ENVIRONMENTAL CONDITIONS

The ASTM E 1527-13 Standard defines a CREC as a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

The following CREC were identified in connection with the Subject Property.

CREC #1: Historical releases from USTs, controlled with a restrictive covenant on the Subject Property

Releases occurred from seven USTs that were previously located on the Subject Property. Groundwater monitoring indicated that enhanced aerobic and anaerobic biodegradation pilot studies were effective in reducing concentrations of petroleum hydrocarbons and VOCs in groundwater. The Subject Property obtained regulatory closure in November 2011 from the Alameda County Department of Environmental Health (ACDEH) with a Covenant and Environmental Restriction (i.e., deed restriction) that limits future land use of the Subject Property to industrial purposes. A Site Management Plan (which is essentially a Soil Management Plan) is also in place to address potential future exposure to residual subsurface impacts by setting the specifications and protocol for how soil has to be managed at the Subject Property.

HISTORICAL RECOGNIZED ENVIRONMENTAL CONDITIONS

The ASTM E 1527-13 Standard defines an HREC as "a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls)."

The following HRECs were identified in connection with the Subject Property.

HREC #1: Waste material from the Subject Property entered into Elmhurst Creek.

During site inspections in April and May 1995, a black powdery waste material was observed throughout the Subject Property on the paved areas and outside of the facility. The black and gritty material was determined to consist of lead, zinc, copper, chromium, and arsenic at concentrations that exceeded the then-allowable regulatory levels. Deposits of the waste material were observed in Elmhurst Creek from a nearby wastewater outfall. In 1999, the regulatory case was closed by the RWQCB following cleanup, and a no further action (NFA) letter was obtained. Haley & Aldrich recommends no further investigation regarding this issue.

DATA GAPS

Our ability to identify and evaluate RECs at the Subject Property is conditioned upon data gaps identified as part of this Phase I.

The Subject Property includes various equipment and associated features permitted by ACDEH Certified Unified Program Agency (CUPA), which are identified in the Subject Property's Hazardous Material Business Plan (HMBP) and Spill Prevention, Control, and Countermeasures (SPCC) Plan. These features and equipment are required to undergo a closure assessment with the CUPA, including the collection of soil samples to determine if release of petroleum hydrocarbon compounds and/or hazardous materials may have occurred and impacted the subsurface environment. CUPA closure is required prior to obtaining permission to redevelopment of the Subject Property. As no sampling has yet been performed to comply with the required CUPA closure assessment, this is considered a data gap.

DE MINIMIS CONDITIONS

The ASTM E 1527-13 Standard defines *de minimis* conditions as those conditions which "do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies." The ASTM E 1527-13 Standard notes that "conditions determined to be *de minimis* are not recognized environmental conditions."

The following *de minimis* conditions were identified in connection with the Subject Property.

De Minimis #1: Stained concrete and pavement observed throughout the Subject Property during the Site Reconnaissance especially in the special finishing storage building, as noted on Figure 3 and in Appendix E. Haley & Aldrich concludes that the scope and extent of the staining, however, does not qualify as a Recognized Environmental Condition and recommends no further action or investigation regarding this issue.

De Minimis #2: The site adjacent to the Subject Property to the south, at 8255 San Leandro Street, is occupied by SF Oakland Truck Stop and has three active USTs used for fueling. Considering this site is adjacent and hydrologically cross-gradient to the Subject Property, and is an active and regulated fueling station, this site poses a potential environmental risk to the Subject Property. Based on the findings of this Phase I ESA, however, Haley & Aldrich has identified no evidence that releases from the facility have affected the environmental condition of the Subject Property. Haley & Aldrich recommends no further investigation regarding this issue.

SUMMARY AND RECOMMENDATIONS

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527 in regard to the Subject Property. Any exceptions to, or deletions from, this practice are described in the Data Gaps section of this report. This assessment has revealed no evidence of recognized environmental conditions (RECs) in connection with the Subject Property except those three RECs, one CREC, and one HREC discussed above.

The remainder of this report contains additional information regarding the Phase I ESA, the resulting findings summarized above, and limitations affecting this report.

1. Introduction

This report presents the results of an ASTM Phase I Environmental Site Assessment (Phase I ESA) conducted at the American Brass and Iron (AB&I) Foundry at 7741, 7825, and 7929 San Leandro Street in Oakland, California (herein referred to as the "Subject Property"; Figure 1). The approximately 14.5-acre Subject Property is developed with an office building, manufacturing and warehouse buildings, as well as a parking lot, stockpile areas, and a shipping yard. This Phase I ESA was conducted in consideration of Duke Realty Corporation (Duke)'s intention to purchase and redevelop the Subject Property as a warehouse and parking lot.

1.1 OBJECTIVE

The objective of a Phase I is to assess whether "recognized environmental conditions" (REC), historical RECs (HREC), and controlled RECs (CREC) are associated with the Subject Property by evaluating site history, interviews, existing observable conditions, current site use, and current and former uses of adjoining properties as well as potential releases at surrounding properties that may impact the Subject Property. Our conclusions are intended to help the user evaluate the "business environmental risk" associated with the Subject Property.

RECs are defined in the ASTM E 1527-13 Standard as "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment." The definitions of RECs, HRECs, and CRECs are included in the Glossary section of this report.

1.2 SCOPE OF SERVICES

This work was performed by Haley & Aldrich, Inc. (Haley & Aldrich) and this Phase I was performed in conformance with the scope and limitations of the ASTM E 1527-13 Standard and All Appropriate Inquiries (AAI) Rule[2] and in accordance with the Duke Realty Corporation Professional Services Agreement dated 9 February 2022 as authorized on 10 February 2022. The Phase I limitations are attached hereto as Appendix A.

As part of this Phase I, Haley & Aldrich conducted visual observations of site conditions and of abutting property use and interviewed a key site manager and applicable tenant representatives (site reconnaissance); reviewed federal, state, tribal, and local environmental database information, federal and state environmental files, previous reports (if identified and provided), and site historical use records; and formulated conclusions regarding the potential presence and impact of RECs.

1.3 NON-SCOPE CONSIDERATIONS

The ASTM E 1527-13 Standard includes the following list of "additional issues" that are non-scope considerations outside of the scope of the ASTM Phase I practice: asbestos-containing materials,

[2] American Society for Testing and Materials (ASTM) E 1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process as referenced in 40 Code of Federal Regulations (CFR) Part 312 (the All Appropriate Inquiries [AAI] Rule) ("ASTM E 1527-13 Standard"). Specified terms as are used in ASTM E 1527-13 are highlighted in blue in this report and defined in the Glossary at the end of the report text.

biological agents, radon, lead-based paint, lead in drinking water, wetlands, regulatory compliance, cultural and historic resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality unrelated to releases of hazardous substances or petroleum products into the environment, and mold. These items were not included in this Phase I of the Subject Property.

A limited assessment of the presence of polychlorinated biphenyls (PCBs) is included in the ASTM work scope. Accordingly, our assessment of the presence of PCBs is limited to those potential sources specified in the ASTM E 1527-13 Standard as "electrical or hydraulic equipment known or likely to contain PCBs…to the extent visually and or physically observed or identified from the interview or records review."

1.4 LIMITING CONDITIONS/DEVIATIONS

Haley & Aldrich completed this Phase I in substantial conformance with the ASTM E 1527-13 Standard. In our opinion, no additions were made to or deviations and deletions made from the ASTM work scope in completing this Phase I.

1.5 USER RESPONSIBILITIES

The completion of this Phase I is only one component of the process required to satisfy the AAI Rule. In addition, the user must adhere to a set of user responsibilities as defined by the ASTM E 1527-13 Standard and the AAI Rule. User responsibilities are discussed in Section 6.6 of this report. A user seeking protection from Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) liability as an innocent landowner, bona fide prospective purchaser, or contiguous property owner must complete all components of the AAI process in addition to meeting ongoing obligations. AAI components, CERCLA liability relief, and ongoing obligations are discussed in the AAI Rule and in Appendix XI of the ASTM E 1527-13 Standard.

2. Site Description

A description of the Subject Property is detailed in the sections below. Refer to Figure 1 for a project locus and Figures 2 and 3 for site maps showing relevant site features and adjacent properties.

2.1 SITE OWNERSHIP, LOCATION, AND VICINITY DESCRIPTION

Site Description	
Owner	McWane, Inc.: • Parcels 41-4175-5, 41-4175-6, 41-4175-18, 41-4175-19, 41-4209-1-1, 41-4209-1-2, 41-4209-3-2, 41-4209-5-1, 41-4209-7, and 41-4209-8-1 Bosley Investments LTD: • Parcels 41-4175-3-2, 41-4175-16, and 41-4175-17 Ciudad Holdings LLC: • Parcel 41-4175-10 Boscacci Allan J & Mark Melvyn I Trs: • Parcel 41-4208-1
Occupant	AB&I Foundry
Current Site Use	Gray iron foundry producing cast iron pipe and pipe fittings
Size	Approximately 14.5 acres
Building Square Footage	Central Structure: Approximately 190,000 square feet Northwestern warehouse structures: Approximately 40,000 square feet
USGS 7.5 Minute Topographic Map	Oakland East, CA, 2018
Site County	Alameda
Zoning	IG – Industrial General

	Gas/Oil/LPG:	PG&E

Site Vicinity Description		
General Area Description	Mixed commercial / industrial	
Adjoining Property Description	North:	Union Pacific Railroad followed by Hegenberger Road.
	East:	San Leandro Street followed by industrial warehouses.
	South:	Commercial space including Estrellas De Sinaloa (restaurant), U.S. Spring Service, an automotive service store, and SF Oakland Truck Stop, a truck repair business.
	West:	Union Pacific Railroad followed by Elmhurst Creek.

2.2 PHYSICAL SETTING

Subsurface explorations and/or hydrogeologic investigations were not performed for this Phase I. Subject Property geology and hydrology were based on previous subsurface explorations conducted by The Source Group, Inc. (SGI), readily available public information or references, and/or based upon our experience and understanding of subsurface conditions in the vicinity of the Subject Property. It is unknown to what extent localized variations in groundwater depth and flow occur on the Subject Property.

Physical Setting		Source
Topography Summary	The Subject Property is generally flat.	1
Site Elevation	Approximately 10 feet above mean sea level	1,2

Physical Setting		Source
Overburden Soils	The fill material was observed to be a mixture of sandy/silty clay to at least 20 feet below ground surface (bgs). Native material consists of East Bay alluvial plain sediments, which consists of unconsolidated, moderately sorted, fine sand and silt, with clayey silt and occasional thin beds of coarse sand.	3, 4
Depth to Groundwater	Approximately 4 to 12 feet bgs	3, 4
Surface Water Flow Direction	Surface water appears to flow towards the west based on observed surface topography.	1
Regional Groundwater Flow Direction	Regional groundwater flow appears to flow to the northwest based on groundwater monitoring.	3, 4
Nearest Surface Water Body	Elmhurst Creek is located adjacent to the Subject Property to the south, and flows into San Leandro Bay, approximately 0.8 miles west of the Subject Property.	2
Floodplain	Yes, the subject Property is within a 500-year flood hazard area.	5
Mapped Wetlands	No	6

- *Storm Water Pollution Prevention Plan and Monitoring Implementation Plan,* prepared by AB&I Foundry, dated January 2022.

3.1 SITE INVESTIGATION REPORT – FEBRUARY 2008

Seven underground storage tanks (USTs) were previously located on the Subject Property, including one 8,000-gallon UST containing unleaded gasoline, one 550-gallon and three 10,000-gallon USTs containing regular leaded gasoline, one 10,000 gallon UST containing diesel, and one 8,000-gallon UST initially containing mineral spirits and then later 1,1,1-trichloroethane (1,1,1-TCA). The three 10,000-gallon regular leaded gasoline USTs were removed from the Subject Property in 1987 and the remaining USTs were removed between August 1991 and June 1992. According to the USTCF 5-Year Review Summary, approximately 680 cubic yards of affected soil was removed during the combined UST removals. Closure reports were not available for the three 10,000-gallon regular leaded gasoline USTs. Contamination related to the 550-gallon gasoline UST, 8,000-gallon mineral spirits/1,1,1-TCA UST, and 10,000-gallon diesel UST was documented during the UST removal. In several cases, the extent of contamination could not be determined due to physical limitations during removal.

In 1993, four groundwater monitoring wells (MW-1 through MW-4) were installed in the areas of the removed USTs. Between 1993 and 1997, sampling results indicated the presence of petroleum hydrocarbons and chlorinated volatile organic compounds (cVOCs) in groundwater near the former USTs.

In 2006, five new monitoring wells (MW-5 though MW-9) were installed, and MW-2 was replaced with MW-2R as the original well had been damaged beyond repair. In July and August 2006, groundwater sampling from the monitoring wells indicated that five of the nine wells had concentrations of at least one compound of total petroleum hydrocarbons (TPH) in the gasoline and diesel range (TPH-G and TPH-D, respectively); benzene, toluene, ethylbenzene, and xylene (BTEX); polycyclic aromatic hydrocarbons (PAHs); and/or volatile organic compounds (VOCs) at concentrations that exceeded their respective U.S. Environmental Protection Agency (USEPA) maximum contaminant level (MCL) or California Regional Water Quality Control Board – San Francisco Bay Region (RWQCB) Environmental Screening Levels (ESLs) for groundwater that is a current or potential source of drinking water.[3]

A site investigation dated 14 February 2008 was prepared by The Source Group (SGI) for AB&I Foundry. The site investigation included collecting soil, groundwater, and soil gas samples for analysis to assess the source and extent of petroleum hydrocarbon and VOC contamination in soil and groundwater. The site investigation focused on the areas of former USTs and the parking lot. Of the ten soil gas samples analyzed, seven samples contained concentrations of chloroethane; BTEX, and tetrachloroethane (PCE) above the laboratory reporting limit but below the RWQCB ESLs. Soil samples from the area of the former three 10,000-gallon and 550-gallon gasoline USTs had detections of TPH in the TPH-G and TPH-D ranges, respectively, as well as trace concentrations of ethylbenzene. The detected concentrations indicate that a leak in the gasoline USTs area had likely occurred, but that contamination appears to be limited to approximately 20 feet bgs. Soil samples collected from the area of the former 8,000-gallon mineral spirits UST had detected concentrations of TPH-G and TPH-D primarily within the top 10 feet bgs. A tar-like material was noted at approximately 4 feet bgs that was interpreted to be the same material used to coat new manufactured product pipes in the production area. Samples collected near the tar-like material had detections of PAHs. Several metals were detected above naturally occurring background levels in samples taken from throughout the Subject Property. However, SGI indicated that the detections of metals was likely due to imported fill and not due to site-related activities. In groundwater samples from both grab samples and monitoring wells, concentrations of TPH-G and TPH-D

[3] Results presented in Sections 3.1 through 3.5 are being compared against the ESLs current at the time of the sampling activities.

were detected. In groundwater samples across the Subject Property, only concentrations of vinyl chloride and 1,1-dichloroethane (1,1-DCA) exceeded their respective ESLs for groundwater where groundwater is not considered a current or potential source of drinking water. A review of historical groundwater data indicated that detected cVOC concentrations were either stabilized or declining. As a result, SGI concluded that the Subject Property was a low-risk release site and recommended that quarterly monitoring of all nine monitoring wells continue to confirm that concentrations are steady or declining.

3.2 ADDITIONAL SITE INVESTIGATION – SEPTEMBER 2008

An additional site investigation dated 25 September 2008 was conducted to further delineate the extent of petroleum hydrocarbon and VOC contamination in the groundwater. This additional site investigation included collecting soil samples, soil gas samples, and groundwater samples both as grab samples and from existing monitoring wells. Of the six soil samples analyzed, two samples near the former three 10,000-gallon regular leaded gasoline USTs had a concentration of either TPH-G or TPH-D above ESLs.

In groundwater samples collected from monitoring wells, only vinyl chloride exceeded the ESL for commercial land use. In groundwater samples collected as grab samples, there were no detected concentrations above ESLs. One grab groundwater sample in the area of the former three 10,000-gallon regular leaded gasoline USTs had detected concentrations of TPH-G, 1,2-dichloroethane (1,2-DCA), cis-1,2-dichloroethene (cis-1,2-DCE), BTEX, vinyl chloride, and naphthalene below ESLs; two grab groundwater samples had detections of TPH-G, 1,1-DCA, 1,1-dichloroethene (1,1-DCE), 1,2-DCA, cis-1,2-DCE, and vinyl chloride below ESLs. Five soil vapor samples were collected. Samples collected from two locations in the Office Building (adjacent to the former 550-gallon gasoline UST) had concentrations of vinyl chloride, and one sample additionally had concentrations of PCE above its respective ESL under the commercial exposure scenario.

3.3 SUPPLEMENTAL SOIL VAPOR INVESTIGATION – APRIL 2009

A supplemental soil vapor investigation dated 22 April 2009 was conducted to assess soil gas conditions beneath the enclosed portions of the Office Building and assess any potential health effects to indoor workers related to soil gas. In one of the three soil gas samples, PCE was the only compound detected at a concentration above RWQCB ESLs for the commercial land-use scenario. Because PCE exceeded its ESL, a site-specific risk assessment was performed to estimate human health risks. Using the data collected, SGI determined the calculated total excess cancer risk estimate was within the USEPA acceptable risk range.

3.4 PILOT STUDIES – OCTOBER 2009

On 4 November 2008, Alameda County Environmental Health Department (ACDEH) submitted a letter to AB&I stating that “the mass of residual fuel hydrocarbons present below the water table constitutes on ongoing source of groundwater contamination” in the area of the former three 10,000-gallon USTs. Therefore, ACDEH requested that AB&I “implement cleanup to reduce the mass of residual fuel hydrocarbons in the source area.” In addition, ACDEH expressed concern regarding the apparent recalcitrance of cVOCs in groundwater, associated with releases from the former 8,000-gallon mineral spirits/1,1,1-TCA UST, to further breakdown, which could promote the accumulation of vinyl chloride.

For the aerobic biodegradation study, a total of 1,200 pounds of oxygen releasing compound (ORC)/Regenox were injected into nine locations in the warehouse, adjacent to the area of the former three 10,000-gallon regular leaded gasoline USTs. Data collected over 3 months suggest that injection activities were effective in raising dissolved oxygen levels and reducing benzene and toluene concentrations. However, TPH-G and TPH-D concentrations remained relatively stable.

For the anerobic biodegradation study, an emulsified oil substrate (EOS) mixture was injected into 15 locations in the parking lot area, ten locations upgradient from well MW-8 and five points upgradient of MW-3. Following the 3 months of monitoring, data indicated that the anaerobic biodegradation injection activities were successful in reducing cVOC concentrations. CVOC concentrations in well MW-3 decreased to concentrations that were below the approved short-term cleanup goals. In well MW-8, the concentration of 1,1,1-TCA was reduced to 45 micrograms per liter (µg/L), which resulted in an increase of 1,1-DCA and vinyl chloride concentrations. However, total organic carbon (TOC) concentrations and geochemical parameters indicate that conditions are favorable for the continued reduction of cVOCs in the vicinity of MW-8, similar to what was observed in well MW-3. SGI expected that concentrations of both 1,1-DCA and vinyl chloride would decrease over time.

3.5 UST SITE CLOSURE – SEPTEMBER 2010

According to the 2010 monitoring report prepared by SGI, a letter from ACDEH dated 2 March 2010, concurred that no further active remediation was required at the Subject Property at that time. The County requested continued groundwater monitoring of wells MW-3, MW-8, and MW-9 to confirm the effectiveness of enhanced biodegradation. Additional monitoring of these wells occurred in April and June 2010. Based on the recent and historical monitoring results, SGI maintains that with the development of a Site Management Plan and deed restriction for the Site, no further action is warranted, and the Site may be closed based on low risk. On 11 October 2011, the nine monitoring wells on the Subject Property were destroyed in accordance with the requirements of the Alameda County Public Works Agency (ACPWA)

On 29 November 2011, ACDEH submitted a letter for UST case closure on the Subject Property. According to the letter the following conditions remained on the Subject Property: TPH-D in soil at concentrations of up to 5,800 milligrams per kilogram (mg/kg), TPH-G in groundwater at concentrations up to 2,200 µg/L, and vinyl chloride in groundwater at concentrations up to 0.97 µg/L. Given these conditions, a Covenant and Environmental Restriction was recorded for the Subject Property on 22 September 2011. The Covenant and Environmental Restriction (i.e., deed restriction) limits future land use to the current industrial land use only. No excavation, development, or disturbance of any cap is to be conducted on the Subject Property unless expressly permitted in writing by ACDEH. The site management plan describes procedures and contingency plans that should be in place if contaminated soil or groundwater is to be disturbed.

3.6 CURRENT CONDITIONS REPORT – OCTOBER 2021

Between 2019 and 2021, excavation activities were performed by AB&I as part of routine site maintenance and improvement activities in the parking lot (August 2019), scrap pile (September 2019), shipping and storage buildings (January 2020), stormwater retention area (March 2020), and railroad track area (March and June 2021). Soil samples were collected from stockpiles and analyzed for metals and petroleum hydrocarbons. In several areas, lead concentrations in soil exceeded the regulatory screening levels for commercial/industrial land use as well as thresholds for classification as a California

hazardous waste. As the impacted soil excavated from the Subject Property has not been fully characterized or addressed, this constitutes a REC, see Section 7.2.

3.7 ENVIRONMENTAL COMPLIANCE DOCUMENTS

The Subject Property's industrial operations are subject to the following environmental compliance documents, which undergo routine updates:

- Stormwater Pollution Prevention Plan (SWPPP);
- Spill Prevention, Control, and Countermeasure (SPCC) Plan; and
- Hazardous Materials Business Plan (HMBP).

3.7.1 SWPPP

The Subject Property has an active SWPPP dated January 2022 that complies with the National Pollutant Discharge Elimination (NPDES) Industrial Stormwater General Permit requirements. The purpose of the SWPPP is to identify sources of pollution that affect industrial stormwater discharge quality, and implement best management practices (BMPs) to reduce or prevent pollution of stormwater discharges from the Subject Property. The SWPPP includes a list of industrial materials stored or handled at the Subject Property, and describes industrial process and dust and particulate generating activities. BMPs for the Subject Property include good housekeeping including sweeping of impervious areas and regular inspections or catch basins and sumps, preventative maintenance of equipment, training for spill and leak prevention response, appropriate material handling and waste management, and erosion and sediment control. Advanced BMPs include a roof drainage system, and maintained catch basins, trench drains, and sump pumps. The RWQCB regulates the SWPPP.

3.7.2 SPCC Plan

The Subject Property has an active SPCC Plan in accordance with the Clean Water Act (CWA) dated August 2020. The purpose of the SPCC Plan is to outline oil use and storage at the Subject Property and engineering designs implemented to prevent and mitigate oil discharges, identify factors that can lead to the discharge of the oil into nearby waterways, and establish guidelines for the control and disposal of spill and spill material upon discharge. The SPCC lists all oil use and storage on the Subject Property which includes above-ground storage tanks (ASTs) containing asphalt, diesel, oil, gasoline, resins, and other oils; and hydraulic oil reservoirs on various machines, electrical transformer, and asphalt dip tanks. The containers all have secondary containment provided by containment curbs, berms, or double-walled construction. Surface drainage generally flows into three stormwater collection sumps and then pumped into a stormwater collection and treatment system (SWS). The sump near the Special Finishing building is also pumped to this SWS. The cooling water sump collects contact cooling water and is processed in the wastewater treatment system on the Subject Property and does not discharge to surface water. Spill control measures include secondary containment, team member response training, and emergency equipment. The ACDEH Certified Unified Program Agency (CUPA) regulates the SPCC Plan.

3.7.3 HMBP

The Subject Property has an HMBP that was accepted by the ACDEH CUPA on 8 April 2021. The HMBP is required under California Health & Safety Code, Division 20, Section 6.95, and includes an inventory of

hazardous materials used in each area or processing stream for the Subject Property and lists emergency containment and cleanup procedures.

3.8 SUMMARY

Environmental investigation and cleanup activities were performed at the Subject Property between 2008 and 2010 associated with the closure of seven USTs. ACDEH issued closure to the Subject Property and required as industrial controls a Site Management Plan and deed restrictions. No further soil vapor or groundwater sampling activities have since been performed at the Subject Property. As the Subject Property is being evaluated for redevelopment, the previously detected soil vapor and groundwater concentrations are required to be compared against the current ESLs established by the RWQCB, dated July 2019 (Rev 2). This evaluation indicates the Subject Property may contain select petroleum hydrocarbons and VOCs in soil vapor and groundwater at concentrations above the ESLs for assessing potential vapor intrusion risk at commercial/industrial properties. These previously detected concentrations constitute a REC, see Section 7.2.

The Subject Property's industrial operations and features are regulated under its SPWPPP, SPCC Plan, and HBMP. These operations and features are required to undergo closure with the RWQCB and ACDEH CUPA oversight prior to the Subject Property being permitted to proceed with redevelopment.

4. Site History

Haley & Aldrich assessed past usage of the Subject Property and adjoining properties through a review of:

- Sanborn Fire Insurance Maps dated 1925, 1950, 1952, 1959, 1960, 1961, 5965, 1968, and 1969;
- Topographic Maps dated 1897, 1915, 1947, 1948, 1959, 1968, 1973, 1980, 1996, 2012, 2015, and 2018;
- Aerial Photographs dated 1939, 1946, 1958, 1963, 1968, 1974, 1982, 1993, 1998, 2005, 2009, 2012, and 2016;
- City Directories dated 192 through 2017;
- Municipal records;
- Previous reports; and
- Interviews with Subject Property personnel.

Copies of information obtained from historical references reviewed are included in Appendix C. Unless otherwise noted below, per the ASTM standard, sources were reviewed dating back to 1940 or first developed use, whichever is earlier, and at 5-year intervals if the use of the property has changed within the time period.

4.1 SUBJECT PROPERTY

The AB&I Foundry has operated on the Subject Property since 1941. Operations on the Subject Property are primarily the production of cast iron for the manufacturing of pipes and fittings from scrap iron. The process includes scrap metal melting, mold making, fitting and pipe casting, and final finishing and coating of pipes and fittings.

The table below provides a detailed summary of pertinent information from the historical sources reviewed:

Dates	Description of Subject Property	Sources
1925 to 1940	The Subject Property is mostly undeveloped, with three single-family dwellings north of 77th Avenue. The Union Pacific Railroad is present along the western side of the Subject Property. The 1939 aerial photograph shows preparation for development south of 77th Avenue.	Aerial maps, Sanborn Maps

Dates	Description of Subject Property	Sources
1941 to 1959	According to the Ramboll Current Conditions Report, AB&I Foundry has operated on the Subject Property since 1941. The 1946 aerial photograph shows a majority of the site had been graded and several of the smaller foundry buildings were constructed. The 1950 and 1952 Sanborn maps show the main foundry building, as well as an oil reclaiming plant, truck spray painting, shed, and storage areas for scrap iron piles. Starting in 1955 Chevron gas station was associated with the address 7617 San Leandro Street on the northern portion of the Subject Property. The 1958 Sanborn map shows the expansion of the oil reclaiming plant, additional small buildings on the north end of the Subject Property, and the construction of a railroad spur leading onto the Subject Property from the Union Pacific Railroad to the west.	Aerial maps, Sanborn Maps, Previous Reports, City Directory
1960 to 1980s	No significant changes are observed in the aerial photographs and Sanborn maps between 1960 and 1982. The Sanborn maps note that the southeastern corner of the Subject Property is used as a truck yard and has a small building for truck maintenance. The city directory lists Standard Service Gas Station and Standard Oil Co of California Training Station at 7617 San Leandro Street from 1967 to 1970. In 1970 and 1980, the city directory lists Claremont Iron Works associated with the address 727 77th Avenue on the northwestern portion of the Subject Property.	Aerial maps, Sanborn Maps, Previous Reports, City Directory
1993 to present	In 1993 the main foundry building was expanded to the north, and the current sand storage building was constructed at the northwest corner of the Subject Property. Currently, the southern end of the Subject Property is used as a pipe storage yard. From 2004 to 2009, the city directory lists Alliance Gas Products and Alliance Welding associated with the address 727 77th Avenue on the Subject Property.	Aerial maps, Sanborn Maps, Previous Reports, City Directory

4.2 ADJOINING PROPERTIES

The table below provides a summary of pertinent information from the historical sources reviewed regarding adjacent properties:

Dates	Description of Adjacent Properties	Sources
1925 to 1959	North: The site to the north was undeveloped until the 1940s. The 1950 Sanborn map shows the site was primarily a scrap metals storage yard and contained an office building and a hydraulic press. South: The site to the south was undeveloped until the 1940s. The 1950, 1952 and 1959 Sanborn maps show the site was occupied by an automobile service station including a gas and oil fueling station. East: The 1925 Sanborn map shows the railroad in its present position. The 1946 aerial photograph shows the Sunshine Biscuits Factory and San Leandro Street were constructed and the other sites to the east were graded for development. The 1950 and 1952 Sanborn maps show the Mothers Cake and Cookie Factory, and steel fabricating buildings were constructed. West: The 1925 Sanborn map shows the railroad in its present position. The 1950 and 1952 Sanborn maps show small buildings used for freight depot and automobile repair.	Aerial maps, Sanborn Maps
1960 to 1970	North: The 1965 Sanborn map shows a steel boat building was constructed on the site in addition to the scrap metals yard. The 1968 aerial photograph and topographic map shows that the present Hegenberger Road overpass was constructed on the site. South: No change. The 1968 and 1969 Sanborn maps show the building on the site besides the automobile service station is vacant. East: No Change. Factories are still occupied by Sunshine Biscuits Inc. and Mother's Cake and Cookie Co during this time. West: No change.	Aerial maps, Sanborn Maps, Topographic Maps

Dates	Description of Adjacent Properties	Sources
1970 to present	North: In 2013 and 2014, the Oakland Airport BART line was constructed to the north of Hegenberger Road. South: No major changes to buildings are observed. The site is currently occupied by: • US Spring Service, a truck parts store; • Estrellas De Sinaloa, a restaurant; • SF Oakland Truck Stop, a gas service station; and • A Eastbay Truck Wash. East: No major changes to buildings observed. The Sunshine Biscuits occupied one of the factory buildings until 1996; the building is currently occupied by American Aggregate, U-Haul Moving and Storage, and Best Cabinet. Mother's Cookies and Cake occupied the other factory building until 2009. The building is currently occupied by Nug cannabis distributer, Premier Organics food products, and El Sazón Oakland restaurant. Lakeside Recycling currently occupies the site to the north of the factory buildings. West: The 1993 Sanborn map shows an additional building was constructed on the site. From at least 2011 through 2015 the site was used as truck parking and office space for U-Haul. The site is currently vacant.	Aerial maps, Sanborn Maps, Topographic Maps, City Directories

5. Environmental Records Review

5.1 ENVIRONMENTAL DATABASE RECORDS SEARCH

Haley & Aldrich used the electronic database service, Environmental Data Resources (EDR) to complete the environmental records review. The database search was used to identify properties that may be listed in the referenced agency records, located within the ASTM-specified approximate minimum search distances as shown in the table below. A description of each database searched is in Section 11.2 of this report. The complete environmental database report is provided in Appendix D. Pertinent information obtained from the database is summarized in Section 5.3 below.

Database Searched	Approximate Minimum Search Distance	Subject Property Listed?	Number of Sites within Search Distance[1]
1. NPL Sites	1 mile	No	0
2. Delisted NPL Sites	0.5 mile	No	0
3. CERCLIS[2] Sites	0.5 mile	No	4
4. CERCLIS-NFRAP[2] Sites	0.5 mile	No	9
5. Federal ERNS	Site only	No	Not Applicable
6. RCRA non-CORRACTS TSD Facilities	0.5 mile	No	1
7. RCRA CORRACTS TSD Facilities	1 mile	No	2
8. RCRA Generators	Site & Adjoining	Yes	8
9. Federal Institutional/Engineering Controls	Site Only	No	Not Applicable
10. State/Tribal Equivalent NPL Sites	1 mile	No	5
11. State/Tribal Equivalent CERCLIS[2] Sites	0.5 mile	No	17
12. State/Tribal Registered Storage Tanks	Site & Adjoining	No	4
13. State/Tribal Landfills and Solid Waste Disposal Sites	0.5 mile	No	2
14. State/Tribal Leaking Storage Tanks	0.5 mile	Yes	52
15. State/Tribal Institutional Controls/Engineering Controls	Site Only	Yes	Not Applicable
16. State/Tribal Voluntary Cleanup Sites	0.5 mile	No	4
17. State/Tribal Brownfield Sites	0.5 mile	No	2
18. Orphan Site List[3]	Site & Adjoining	No	0

Notes:

1. *Some sites may be included on multiple databases.*
2. *The USEPA retired the CERCLIS database in October 2013. In January 2016, the Superfund Enterprise Management System (SEMS), which replaces the CERCLIS database, became active. The CERCLIS database records search included as part of this assessment includes currently ascertainable data from the SEMS and SEMS-Archive databases as reported through the database vendor.*
3. *Haley & Aldrich also searched the Orphan Site List provided in the database report for the Subject Property and sites adjoining the Subject Property. Orphan sites are those that, due to incorrect or incomplete addresses, could not be mapped.*

5.2 ADDITIONAL ENVIRONMENTAL RECORDS OR FILE REVIEW

To supplement the environmental record search, we contacted the following state and local government agencies and searched applicable online databases. If copies of the documents reviewed were obtained, pertinent material is included in Appendix D. Relevant information obtained is included in the appropriate sections of the report and/or discussed in Section 5.3 below. Adjacent properties were also included in requests for additional information if a significant incident or release was identified. Those adjacent properties reviewed for this assessment include:

Agency	Request Sent or Files Searched		Files Exist and are Available for Review	Files Reviewed
	Subject Property	Adjoining Properties		
Department of Toxic Substances Control (DTSC)[1]	Yes	No	On 4 February 2022, DTSC responded that they do have hard copies of records pertaining to the Subject Property, but that in-person appointments are not available due to COVID-19 restrictions. The DTSC's website, EnviroStor, generally contains all existing DTSC information on permits and corrective action at hazardous waste facilities, as well as site cleanup projects. There were no EnviroStor files pertaining to the Subject Property. EnviroStor listed a preliminary site assessment report for a possible UST on the adjacent site to the south (8261 San Leandro Street) but did not have documents to review. See Section 5.3.2 below.	No[7]

Agency	Request Sent or Files Searched		Files Exist and are Available for Review	Files Reviewed
	Subject Property	Adjoining Properties		
San Francisco Bay Regional Water Quality Control Board (RWQCB)[2]	Yes	No	On 4 February 2022, RWQCB indicated that there is a closed case for the Subject Property with files on GeoTracker. The State Water Resources Control Board's (SWRCB's) website, GeoTracker, generally contains information on sites that impact groundwater, especially those that require groundwater cleanup, and permitted facilities. GeoTracker files pertaining to the subject site and adjacent and nearby properties are discussed in Sections 3.1 through 3.4 above and Section 5.3.1 below. RWQCB also indicated that there is an active industrial stormwater NOI permit, WDID number 01I002972, associated with the Subject Property. The stormwater permit documents are discussed in Section 5.3.1.	Yes
California Governor's Office of Emergency Services (Cal OES)[3]	Yes	No	The online Cal OES database was accessed on 27 January 2022. There were no records for the Subject Property. Hazardous materials spill reports for the nearby sites were reviewed. The reported spills were either small (less than 1 gallon) or over 0.5 miles from the Subject Property, and so do not appear to impact the Subject Property.	Yes
Bay Area Air Quality Management District (BAAQMD)[4]	Yes	No	On 4 February 2022, BAAQMD responded with a list of violations associated with the Subject Property. See Section 5.3.1 below.	N/A
Alameda County Department of Environmental Health (ACDEH)[5]	Yes	Yes	On 27 January 2022, ACDEH responded with several records pertaining to the Subject Property and the adjacent SF Oakland Truckstop at 8255 San Leandro Street. See Section 5.3.1 below.	Yes

Agency	Request Sent or Files Searched		Files Exist and are Available for Review	Files Reviewed
	Subject Property	Adjoining Properties		
City of Oakland Fire Department[6]	Yes	No	The Oakland Fire Department responded on 7 April 2022 with Operational Fire Permits (for use of hazardous materials and compressed gases, and welding operations) and Inspection Work Orders (for annual and 3-year inspections) for the Subject Property and 8255 San Leandro Street.	Yes

Notes:

1. *The California Department of Toxic Substances Control maintains records related to site cleanups, hazardous waste, and USTs.*
2. *The San Francisco Bay Regional Water Quality Control Board maintains information regarding water, monitoring wells, USTs, and cleanups.*
3. *The California Governor's Office of Emergency Services maintains records of hazardous materials spill reports.*
4. *The Bay Area Air Quality Management District maintains information regarding indoor air, asbestos, equipment permitting, and violations related to air quality.*
5. *The Alameda County Department of Environmental Health maintains records related to hazardous materials and waste, USTs, and site mitigation.*
6. *The City of Oakland Fire Department maintains information regarding permits and fire inspection records.*
7. *As extensive files were available from GeoTracker and other agencies, this potential data gap is not expected to impact the results of this assessment.*

5.3 DETAILED DESCRIPTION OF RELEVANT INFORMATION

5.3.1 Subject Property

Listing	Description	Potential Impact
GeoTracker, RGA LUST, CERS, SWEEPS UST, HIST UST, CA FID UST, CERS TANKS, CORTESE, HIST CORTESE,	Releases occurred from seven USTs that were previously located on-site. The USTs included one 8,000-gallon UST containing unleaded gasoline, one 8,000-gallon UST containing mineral spirits and later 1,1,1-TCA, one 550-gallon UST containing leaded gasoline, one 10,000-gallon UST containing diesel, and three 10,000-gallon USTs containing leaded gasoline. Pilot studies were conducted including an enhanced aerobic biodegradation study to address a plume of petroleum hydrocarbons near the warehouse, and an enhanced anerobic biodegradation study to address a plume of chlorinated solvents in groundwater in the parking lot. Groundwater monitoring indicated that the pilot studies were effective in reducing contaminant concentrations in groundwater. The site was closed with a Covenant and Environmental Restriction on the Subject Property (i.e., deed restriction) that limits future land use to industrial. A Site Management Plan is also in place to address potential future exposure to residual contamination. See Section 3.2 for a summary of reviewed reports related to the UST leak and subsequent site investigations. The EDR report includes separate listings for Chevron Training Center and Gray's Chevron service that operated on the Subject Property at 7617 San Leandro Street from approximately 1955 to 1962. However, the listings for the AB&I Foundry leaking underground storage tank (LUST) events are inclusive of the Chevron site.	This constitutes a CREC. See Section 7.3.

Listing	Description	Potential Impact
AST, CERS HAZ WASTE, RCRA LQG, WDS, HIST FTTS, HWTS, HAZNET, TSCA, ACDEH CUPA	Two 1,000-gallon diesel ASTs are located on the Subject Property – one in the parking lot and one south of the foundry building. The Subject Property is currently a RCRA large quantity generator of hazardous waste. Several minor administrative violations are noted in the EDR report in 2004, 2014 and 2019. Violations were brought into compliance by the Subject Property. Alliance Gas Products operated on the Subject Property at 727 77th Avenue from approximately 2003 to 2006. Alliance Gas Products was listed as a RCRA small quantity generator of hazardous waste. The WDS listing indicates the Subject Property treats and/or disposes of liquid or semisolid wastes from any servicing, producing, manufacturing, or processing operation.	No spills or releases are associated with these listings. This does not appear to impact the subject site.
CPS-SLIC, NPDES, SWPPP	Since 1992 AB&I Foundry has held an industrial stormwater NPDES permit to discharge treated non-contact cooling water and stormwater to the nearby Elmhurst Creek. Since 1995, non-contact cooling water has been recycled on the Subject Property in a closed loop system. The NDPES permit requires a SWPPP for the Subject Property with annual inspections, monitoring, and sampling. During site inspections in April and May 1995, a black powdery waste material was observed throughout the site on the paved areas and outside of the facility. The black and gritty material was sampled, analyzed, and determined to consist of lead, zinc, copper, chromium, and arsenic at concentrations that exceed the allowable levels. Deposits of the waste material were observed in Elmhurst Creek at the wastewater outfall W0001. In 1999 the case was closed, and a no further action (NFA) letter was sent by the RWQCB SLIC list.	This constitutes an HREC. See Section 7.4

Listing	Description	Potential Impact
SMARTs, ACDEH CUPA, SPCC, HMBP	In 2016 ACDEH records indicate the Subject Property had violations of HMBP, large quantity generator (LQG), and aboveground petroleum storage tank (APSA) regulations. Corrective action by ACDEH for the Subject Property to demonstrate a return to compliance was to collect stormwater samples for California Assessment Manual metals and acute aquatic toxicity. In 2017 and 2018, stormwater samples taken at the Subject Property exceeded Numeric Action Levels (NALs) for magnesium. In 2020 stormwater samples exceeded NALs for aluminum. BMPs implemented to limit exceedances in the 2021 and 2022 monitoring cycles include storing gasoline and waste materials under cover, daily sweeping and housekeeping procedures, dust control water sprayers, and concrete containment blocks to divert stormwater. As of 1 January 2021, AB&I stopped operations at the Subject Property, removing a large portion of potential pollutant sources. The Subject Property has active environmental compliance documents including an SPCC Plan, and an HMBP to identify hazardous materials on the Subject Property and prevent and control releases of those materials. These compliance documents are discussed in Section 3.7.	As this issue is ongoing, this constitutes a REC. See Section 7.2.
ICIS, US AIRS, EMI, BAAQMD	The Subject Property has held air emission permits and participated in the State Implementation Plan for National Primary and Secondary Ambient Air Quality Standards and BAAQMD programs since 1990. Between 1990 and June 2021 the Subject Property has received 61 violations from the state, the majority of which have been resolved either in court or by administrative action.	As the violations have been addressed and are a general compliance concern, this does not appear to impact the Subject Property.
OES spill reports	In January 2016 an oil spill of approximately 1 gallon was reported. The spill was contained by an emergency spill kit and no waterways were impacted.	This does not appear to impact the Subject Property.

5.3.2 Nearby Sites

Several sites were listed in the database report within the applicable search radii or identified in regulatory records reviews. Due to their location with respect to the Subject Property (on the opposite side of a hydrogeologic barrier, distance from the site, location of the site relative to inferred groundwater flow, subsurface utilities and building levels, etc.), or their status (closed out release, etc.), several of the sites are not likely to adversely affect the Subject Property and are not discussed herein. Only those sites adjacent to the Subject Property and sites with a potential to have impacted the Subject

Property are discussed below. The complete database report and relevant records review information is included in Appendix D.

Property Name & Location	Database/ Record Identified	Description	Potential Impact to Subject Property
U-Haul Moving and Storage of Oakland 8000 San Leandro Street Adjacent beyond San Leandro Street to the east, hydrologically upgradient.	RCRA NonGen/NLR	This listing indicates that U-Haul was a handler of hazardous waste but is no longer reporting. There are no violations associated with this site.	This does not appear to impact the Subject Property.
Engs Lease Plea/CSB Construction Inc/Lakeside Recycling 800 77th Avenue Adjacent beyond San Leandro Street to the east, hydrologically upgradient.	LUST, SWEEPS UST, HIST UST, RCRA NonGen/NLR, HWTS, Alameda County Cs, CORTESE, HAZNET, HIST CORTESE, CIWQS, CERS	This site is associated with GeoTracker case number T0600100419. In 1988 a leak was reported. Contaminated soil was excavated, and the case was subsequently closed as of 2000. The site currently holds a stormwater industrial NPDES permit. Lakeside Recycling was previously a RCRA handler of hazardous waste but is no longer reporting. Several administrative violations were recorded in 2018 and brought into compliance. This site is currently occupied by Lakeside Recycling.	As the site status is closed, this does not appear to pose an environmental concern to the Subject Property.
Mothers Cookies 810 81st Avenue Adjacent beyond San Leandro Street to the east, hydrologically upgradient.	UST, HWTS, LUST, Alameda County CS, SWEEPS UST, CA FID USE, CHMIRS, CORTESE, HAZNET, HIST CORTESE, WDS	This site is associated with GeoTracker case number T0600100943. In 1991 a UST leak was reported. Contaminated soil was excavated, and the case was subsequently closed as of 1994. The WDS listing indicates this site holds an industrial wastewater discharge NPDES permit. The site also handles hazardous waste. The CHMIRS listing indicates that a molasses spill was reported on-site and was cleaned up.	As the site status is closed, this does not appear to pose an environmental concern to the Subject Property.

Property Name & Location	Database/ Record Identified	Description	Potential Impact to Subject Property
F&S Truck Repair (Fctr Corp) / LE Meyers 8261 San Leandro Street Adjacent to the south, hydrologically downgradient.	HWTS, ENVIROSTOR, HAZNET	This site is associated with a closed site on EnviroStor, ID number 1500102. A subsurface investigation was performed on site to investigate potential contamination related to a LUST. The case was closed, and cleanup status listed as no further action as of 1994.	As the site status is closed, this does not appear to pose an environmental concern to the Subject Property.
Elmhurst Creek Sediment Removal and Maintenance Project Adjacent at the southwest corner.	CIWQS, CERS	The EDR report associates this project with 7825 San Leandro Street, however it should be associated with Monterey Mechanical at 8255 San Leandro Street. This project began in 2007 and involved maintenance dredging for at least 5 years in the nearby Elmhurst creek to improve stormwater conveyance capacity and bank stabilization.	This does not appear to impact the Subject Property.
SF Oakland Auto Truck/Roberto's Truck Repair/G&Z Inc/Union 76 Truck Stop 8255 San Leandro Street Adjacent to the south, hydrologically cross-gradient.	LUST, Alameda County CS, CORTESE, CERS, CERS HAZ WASTE, CERS TANKS, HWTS, ENVIROSTOR, SWEEPS UST, SC FID UST, HAZNET, UST RCRA NonGen/NLR	This site is associated with a closed site on GeoTracker, ID number T06019755143. A UST leak was discovered in 1989 and reported in 1990. The CORTESE listing in the EDR report indicates the site was listed as a LUST cleanup site. The case was closed as of 1994. The site is currently occupied by SF Oakland Truck Stop and has three active USTs used for fueling.	Considering this site is adjacent and hydrologically cross-gradient to the Subject Property, and is an active fueling station, this site poses a potential environmental risk to the Subject Property. Haley & Aldrich has not identified, however, any evidence that releases from the facility have affected the Subject Property.

5.4 VAPOR MIGRATION

The ASTM 1527-13 standard states that "for the purposes of this practice, "migrate" and "migration" refers to the movement of hazardous substances or petroleum products in any form, including, for

example, solid and liquid at the surface or subsurface, and vapor in the subsurface." Thus, this section specifies whether or not we perceive a risk of vapor migration to the Subject Property.

To assess a vapor migration risk we conducted a detailed review and analysis of the site-specific environmental database report and/or other reasonably ascertainable records to assess whether:

1. Off-site properties have documented chlorinated volatile organic compound (VOC) contamination located within 100 feet of the subject property, or
2. Off-site properties have documented volatile petroleum hydrocarbon contamination within 30 feet of the subject property.

Based on our records review, we have identified and assessed the following potential sources for vapor migration:

Investigations at the Subject Property have found petroleum hydrocarbon and VOC impacts in soil, groundwater, and soil vapor. Though impacted soil and groundwater have been remediated and exposure is limited by asphalt and cement serving as a cap, there is a potential vapor intrusion risk as the residual soil vapor and groundwater concentrations exceed current ESLs established to assess potential vapor intrusion risk. This is also considered a REC for the subject site. See Section 7.2.

5.5 ENVIRONMENTAL LIEN AND AUL

According to EDR's Environmental Lien and AUL Search™ Report, dated 28 January 2022, there are no environmental liens or activity and use limitations (AULs) for the Subject Property parcels, with the following exception:

- 041-4209-001-01, 041-4209-001-02, 041-4209-003-02,041-4209-008-01, 041-4175-18, 041-4175-19: No environmental lien was found. An AUL in the form of a covenant and environmental restriction was found for this parcel, though it applies to the entire Subject Property at 7825 San Leandro Street. The restrictive covenant is discussed in Section 3.5

This research was completed by EDR using the following Assessor Parcel Numbers provided by Haley & Aldrich:

- 041-4175-010
- 041-4175-016
- 041-4175-017
- 041-4175-018
- 041-4175-019
- 041-4175-003-02
- 041-4175-005
- 041-4175-006
- 041-4208-001
- 041-4209-001-01
- 041-4209-001-02
- 041-4209-003-02
- 041-4209-007
- 041-4209-008-01

A copy of the Environmental Lien and AUL Search™ Report and Deed is included in Appendix D.

5.6 CHAIN OF TITLE

The EDR Chain of Title Report dated 28 January 2022 is included in Appendix D. The current owners are:

- 041-4175-010: Enrique Barraza Sr and Edevelia Barraza
- 041-4175-016, 041-4175-003-02: Bosley Investments LTD
- 041-4175-017: no deed found
- 041-4175-018, 041-4175-019, 041-4208-001, 041-4209-001-01, 041-4209-001-02, 041-4209-007: McWane Inc
- 041-4175-005, 041-4175-006: AB&I Foundry

6. Site Reconnaissance and Key Personnel Interview(s)

A site visit to observe Subject Property conditions was conducted by Zachary Stephens and Michael Zlotoff of Haley & Aldrich, on 4 February 2022. Access to the Subject Property was provided by Michael Lowe of AB&I Foundry.

Haley & Aldrich personnel observed accessible interior areas of the Subject Property building(s), including common areas, work floors, mechanical spaces, and storage spaces. Haley & Aldrich also observed the exterior portions of the Subject Property, including the property boundaries, and observed adjoining property conditions from the Subject Property boundaries and/or public thoroughfares. No weather-related conditions or other conditions that would limit our ability to observe the Subject Property or adjoining properties occurred during our site visit.

An interview with Michael Lowe of AB&I Foundry, the key site manager, was performed in conjunction with the site visit. Per the ASTM Standard, past owners, operators, and occupants of the Subject Property who are likely to have material information regarding the potential for contamination at the Subject Property shall be contacted to the extent that they can be identified and that the information likely to be obtained is not duplicative of information already obtained from other sources. Haley & Aldrich was not provided with contact information in order to interview past owners and/or operators at the Subject Property. Based upon historical data collected from other sources, this potential data gap is not expected to adversely impact the results of this assessment.

The findings of the site visit and interviews are discussed below. Site photographs are included in Appendix E. Figure 2 and Figure 3 provide site maps of the Subject Property showing various operational areas and features.

ASTM E 1527-13 Standard Section 10.8 requires that, prior to the site visit, the current Subject Property owner or key site manager and user, if different from the current owner or key site manager, be asked if there are any helpful documents that can be made available for review. No such documents were provided.

6.1 CURRENT USE OF THE PROPERTY

The Subject Property is currently occupied by AB&I, a gray iron foundry which produces cast iron for the manufacture of pipe and pipe fittings. The Subject Property is developed with a two-story office building, multiple warehouses, foundry operations and manufacturing buildings, material storage areas, and a parking lot.

6.2 GENERAL DESCRIPTION OF STRUCTURES

The central structure on the Subject Property is an approximately 4.5-acre mixed use structure. This structure includes several enclosed buildings, such as a two-story office building and various small offices. The majority of this 4.5 acres is occupied by the work floor, where the cast iron pipes and fittings are made. This work floor is a semi-open structure with enclosed walls on some sides, and half walls on others. There are sections of the work floor that do not have any overhead covering.

On the northwest side of the Subject Property there are several small structures. Approximately 1 acre is split into four even rectangular buildings. Three of these structures are open warehouses, the fourth structure has a small office space towards the front of the building before it opens into a large machining room where the molds for fittings are produced. The four structures stand side by side with each other.

6.3 USE, STORAGE, AND DISPOSAL OF PETROLEUM PRODUCTS AND HAZARDOUS MATERIALS

Petroleum products and/or hazardous materials were observed or reported to be used, stored, and/or disposed of at the Subject Property as described below.

Several types of motor oil used for machinery throughout the Subject Property, and the subsequent used oil, along with several types of greases were observed. Several compressed gases were also observed at the compressed gas station.

Petroleum/hazardous materials observed at the Subject Property included:

Petroleum Product or Hazardous Substances	Quantity Stored & Container	Storage Location	Use	Disposal	Observations/ Evidence of release
Universal Waste	One 55-gallon drum	Near compressed gas station	N/A	Off site	No indication of spillage or release.
MagneGas	Several large, compressed gas cylinders	Compressed gas station	Unknown	Unknown	No indication of spillage or release.
Propylene	Several large, compressed gas cylinders	Compressed gas station	Unknown	Unknown	No indication of spillage or release.
Propane	Several ~20lb tanks	Compressed gas station	Machine and/or vehicle fuel	Unknown	No indication of spillage or release.
Diesel	Two 1,000-gallon aboveground storage tanks	One tank near the hazardous waste storage area, one tank near the engineering shop.	Machine and/or vehicle fuel	Unknown	No indication of spillage or release.
Mobiltherm 603	Several 55-gallon drums	Hazardous waste storage area	Unknown	Unknown	No indication of spillage or release.

Petroleum Product or Hazardous Substances	Quantity Stored & Container	Storage Location	Use	Disposal	Observations/ Evidence of release
SAE 30 Motor Oil	Several 55-gallon drums	Hazardous waste storage area	Unknown	Unknown	No indication of spillage or release.
DTE 26 Hydraulic Oil	Several 55-gallon drums	Hazardous waste storage area	Unknown	Unknown	No indication of spillage or release.
DTE 25 Hydraulic Oil	Several 55-gallon drums	Hazardous waste storage area	Unknown	Unknown	No indication of spillage or release.
DTE 24 Hydraulic Oil	Several 55-gallon drums	Hazardous waste storage area	Unknown	Unknown	No indication of spillage or release.
B-230 Cosmolubric	Several 55-gallon drums	Hazardous waste storage area	Unknown	Unknown	No indication of spillage or release.
Rando HD 46	Several 55-gallon drums	Hazardous waste storage area	Unknown	Unknown	No indication of spillage or release.
“Used Oil”	Large 200- or 250-gallon poly container	Hazardous waste storage area	N/A	Unknown	No indication of spillage or release
Silver 70 Multi-Purpose EP Grease	Several 15-gallon drums	Hazardous waste storage area	Unknown	Unknown	No indication of spillage or release.
CalFoam ES-303	55-gallon drum	Near the wastewater treatment plant	Unknown	Unknown	No indication of spillage or release.
Petroleum Gases liquified	Several large, compressed gas cylinders	Throughout the site	Unknown	Unknown	No indication of spillage or release.
Multifak EP 2	55-gallon drum	Throughout the site	Unknown	Unknown	No indication of spillage or release.

Several different petroleum products were observed in varying quantities, but there was no clear indication that any product has spilled or released into the environment. Liquids were contained in properly kept drums of various sizes with no evidence of damage. No damage was observed to the compressed gas cylinders.

6.4 OTHER SUBJECT PROPERTY OBSERVATIONS

The table below summarizes items that were observed and/or reported at the Subject Property during the site visit other than those items related to use, storage, and disposal of petroleum or hazardous materials (described in Section 6.3 above). If items were observed or reported, they are further described either in the table or below.

Description	Observed or Reported at Time of Site Visit	Observations/Comments
Potable Water Supply	Yes	N/A
Nearest Drinking Water Source	No	N/A
Sewage Disposal System	Yes	N/A
Septic System	No	N/A
Unidentified Storage Containers	No	N/A
Wastewater Discharge	Yes	Wastewater treatment plant located on-site.
Stormwater Discharge	Yes	Stormwater treatment plant located on-site.
Odors	No	N/A
PCBs Associated with Electrical or Hydraulic Equipment	No	Hydraulic equipment and transformers are present on the Subject Property but were not able to be observed during this site visit.
Elevators (Traction or Hydraulic)	No	N/A
Vehicle Maintenance Lifts	Yes	On-site mechanics to repair equipment.
Emergency Generators	No	Emergency generator is present on the Subject Property but it was not able to be observed during this site visit. The location is shown on Figures 2 and 3.
Sprinkler System Pumps	No	N/A
Heating System	Yes	N/A
Cooling System	Yes	N/A
Stains or Corrosion on Floors, Walls, or Ceilings	Yes	Stains located in select areas of various buildings and were noted on site maps.
Floor Drains	Yes	N/A
Sumps	No	Five sumps are present on the Subject Property but they were not able to be observed during this site visit.
Catch Basins	No	Storm drains are present throughout the site. Locations are noted on Figure 2.
Pits, Ponds, Lagoons, and Pools of Liquid	Yes	Pools of liquid observed near the stormwater reclamation area.
Stained Soil or Pavement	Yes	Stains located in select areas of various buildings and were noted on site maps.
Stressed Vegetation	No	N/A

Description	Observed or Reported at Time of Site Visit	Observations/Comments
Solid Waste and Evidence of Waste Filling	Yes	Universal waste drum
Dry Wells	No	N/A
Monitoring Wells	No	N/A
Water Supply Wells	No	The Subject Property contains a known, inactive water supply well but it was not able to be observed during this site visit.
Irrigation Wells	No	N/A
Injection Wells	No	N/A
Abandoned Wells	No	Previous monitoring wells destroyed in October 2011.

Notes:

1. *N/A items are those that were not observed or reported and/or not anticipated to be present given the nature of the site (e.g., building features were not present on an undeveloped property).*

6.5 ADJOINING PROPERTY OBSERVATIONS

Adjoining properties to the Subject Property include the Union Pacific Railroad to the south, followed by Elmhurst Creek. The Union Pacific Railroad also runs directly to the west of the Subject Property, followed by Hegenberger Road. Directly north and east of the Subject Property is San Leandro Road followed by various industrial warehouses or facilities. Southeast of the Subject Property is commercial space including a taqueria, automotive parts stop, carwash, and SF Oakland Truck Stop fueling station. As The SF Oakland Truck Stop has three active USTs, this site poses a potential environmental risk to the Subject Property.

6.6 USER RESPONSIBILITIES

The AAI Rule requires that the User of the report consider the following:

- Whether the user has specialized knowledge about previous ownership or uses of the Subject Property that may be material to identifying RECs;
- whether the user has determined that the Subject Property's Title contains environmental liens or other information related to the environmental condition of the property, including engineering and institutional controls and AULs, as defined by ASTM;
- whether the user is aware of commonly known or reasonably ascertainable information about the Subject Property including whether or not the presence of contamination is likely on the Subject Property and to what degree it can be detected; and
- whether the user has prior knowledge that the price of the Subject Property has been reduced for environmentally related reasons.

While such information is not required to be provided to the environmental professional(s), the information can assist the environmental professional in identifying recognized environmental conditions. The "All Appropriate Inquiries" Final Rule (40 CFR Part 312) requires that these tasks be

performed by or on behalf of a party seeking to qualify for a landowner liability protection (LLP) to CERCLA liability.

Haley & Aldrich conducted an interview with Mr. Jason Bernstein of Duke Realty Corporation, on 18 March 2022. Mr. Bernstein indicated he had no specialized knowledge regarding the subject site not already known to the environmental professional.

7. Findings and Opinions

7.1 DATA GAPS

Our ability to identify and evaluate RECs at the Subject Property is conditioned upon data gaps identified as part of this Phase I.

The Subject Property includes various equipment and associated features permitted by ACDEH Certified Unified Program Agency (CUPA), which are identified in the Subject Property's Hazardous Material Business Plan (HMBP) and Spill Prevention, Control, and Countermeasures (SPCC) Plan. These features and equipment are required to undergo a closure assessment with the CUPA, including the collection of soil samples to determine if release of petroleum hydrocarbon compounds and/or hazardous materials may have occurred and impacted the subsurface environment. CUPA closure is required prior to obtaining permission to redevelopment of the Subject Property. As no sampling has yet been performed to comply with the required CUPA closure assessment, this is considered a data gap.

7.2 RECOGNIZED ENVIRONMENTAL CONDITIONS

The ASTM E 1527-13 Standard defines a REC in part as "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment."

Our opinion regarding a REC's potential impact on the Subject Property is based on the scope of our work, the information obtained during the course of our work, the conditions prevailing at the time our work was performed, the applicable regulatory requirements in effect at the time our work was performed, our experience evaluating similar sites, and on our understanding of the client's intended use for the Subject Property.

The following RECs were identified in connection with the Subject Property.

REC #1: Soil Vapor and Groundwater Concentrations Exceed ESLs

The results of environmental sampling performed in 2008 through 2010 showed concentrations of petroleum hydrocarbons and volatile organic compounds (VOCs) in soil vapor and groundwater at concentrations above the Environmental Screening Levels (ESLs) established by the San Francisco Bay Regional Water Quality Control Board (RWQCB), dated July 2019 (Rev 2), to assess for potential vapor intrusion risk at commercial/industrial properties.

REC #2: Stormwater permit parameter exceedances of magnesium and aluminum

In 2017 and 2018, stormwater samples taken at the Subject Property exceeded Level 2 Numeric Action Levels (NAL) for magnesium. Results of sampling in 2020 show aluminum in stormwater at levels exceeding the NAL for aluminum. The Subject Property is required to demonstrate best management practices (BMP) and sample for magnesium and aluminum through the 2021-2022 monitoring cycle.

REC #3: Industrial use of the Subject Property as a foundry since 1940

The Subject Property has been an active foundry since 1940, which pre-dates most current environmental statutes. While previous investigations focused on areas of former underground storage tanks (USTs), a comprehensive subsurface investigation has not been conducted throughout the Subject Project. For example, soil samples collected from stockpiles generated from excavations performed in locations around the Subject Property between 2019 and 2021 contained lead at concentrations above ESLs as well as the threshold for classification as a California hazardous waste with no source(s) for the elevated lead concentrations identified. Considering this information, the 80 years of industrial operations at the Subject Property poses a potential environmental risk.

7.3 CONTROLLED RECOGNIZED ENVIRONMENTAL CONDITIONS

The ASTM E 1527-13 Standard defines a CREC as a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

The following CREC were identified in connection with the Subject Property.

CREC #1: Historical releases from USTs, controlled with a restrictive covenant on the Subject Property

Releases occurred from seven USTs that were previously located on the Subject Property. Groundwater monitoring indicated that enhanced aerobic and anaerobic biodegradation pilot studies were effective in reducing concentrations of petroleum hydrocarbons and VOCs in groundwater. The Subject Property obtained regulatory closure in November 2011 from the Alameda County Department of Environmental Health (ACDEH) with a Covenant and Environmental Restriction (i.e., deed restriction) that limits future land use of the Subject Property to industrial purposes. A Site Management Plan (which is essentially a Soil Management Plan) is also in place to address potential future exposure to residual subsurface impacts by setting the specifications and protocol for how soil has to be managed at the Subject Property.

7.4 HISTORICAL RECOGNIZED ENVIRONMENTAL CONDITIONS

The ASTM E 1527-13 Standard defines an HREC as “a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).”

The following HRECs were identified in connection with the Subject Property.

HREC #1: Waste material from the Subject Property entered into Elmhurst Creek.

During site inspections in April and May 1995, a black powdery waste material was observed throughout the Subject Property on the paved areas and outside of the facility. The black and gritty material was determined to consist of lead, zinc, copper, chromium, and arsenic at concentrations that exceeded the then-allowable regulatory levels. Deposits of the waste material were observed in Elmhurst Creek from

a nearby wastewater outfall. In 1999, the regulatory case was closed by the RWQCB following cleanup, and a no further action (NFA) letter was obtained. Haley & Aldrich recommends no further investigation regarding this issue.

7.5 *DE MINIMIS* CONDITIONS

The ASTM E 1527-13 Standard defines *de minimis* conditions as those conditions which "do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies." The ASTM E 1527-13 Standard notes that "conditions determined to be *de minimis* are not recognized environmental conditions."

The following *de minimis* conditions were identified in connection with the Subject Property.

De Minimis #1: Stained concrete and pavement observed throughout the Subject Property during the Site Reconnaissance especially in the special finishing storage building, as noted on Figure 3 and in Appendix E. Haley & Aldrich concludes that the scope and extent of the staining, however, does not qualify as a Recognized Environmental Condition and recommends no further action or investigation regarding this issue.

De Minimis #2: The site adjacent to the Subject Property to the south, at 8255 San Leandro Street, is occupied by SF Oakland Truck Stop and has three active USTs used for fueling. Considering this site is adjacent and hydrologically cross-gradient to the Subject Property, and is an active and regulated fueling station, this site poses a potential environmental risk to the Subject Property. Based on the findings of this Phase I ESA, however, Haley & Aldrich has identified no evidence that releases from the facility have affected the environmental condition of the Subject Property. Haley & Aldrich recommends no further investigation regarding this issue.

8. Conclusions

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of the ASTM Practice E 1527 of the American Brass and Iron (AB&I) Foundry property, located at 7741, 7825, and 7929 San Leandro Street in Oakland, California. Any exceptions to or deletions from, this practice are described in Section 1.4 and the Data Gaps section of this report.

This assessment has revealed no evidence of recognized environmental conditions (RECs) in connection with the Subject Property except those three RECs, one CREC, and one HREC discussed above. Investigations at the Subject Property have found petroleum and VOC impacts in soil, groundwater, and soil vapor. Though impacted soil and groundwater has been remediated and its exposure is limited by asphalt and cement serving as a cap, there is a potential vapor intrusion risk. A Site Management Plan is in place to address the special handling and disposal of the soil and groundwater to be encountered during future construction activities.

9. Environmental Professional Certification

The undersigned declare the following:

We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in §312.10 of 40 CFR Part 312 and

We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Maggie Bradshaw
Environmental Scientist

Jason Grant, P.E. (CA)
Senior Project Manager | Engineer

10. Credentials

This Phase I report was prepared by Maggie Bradshaw, and the site visit was conducted by Zachary Stephens, under the direct supervision of Jason Grant, who served as the Environmental Professional(s) for this project. Qualification information for the project personnel is provided below.

Zachary Stephens
Staff Technician

Mr. Stephens holds a B.S. in Environmental Science from Seattle University. Mr. Stephens is an environmental scientist with approximately 1 year of experience and has performed or assisted on a number of ASTM Phase I Environmental Site Assessments for a variety of property types. He has also conducted or assisted on numerous Phase II investigations and other projects involving collection of indoor air and subsurface soil, soil gas, and groundwater samples.

Maggie Bradshaw
Environmental Scientist

Ms. Bradshaw holds a B.S. in Conservation Resource Studies from UC Berkeley. Ms. Bradshaw is an environmental scientist with 5 years of experience. She performs ASTM Phase I Environmental Site Assessments for undeveloped, commercial, and light industrial properties. She also has experience conducting Phase II investigations, including collecting subsurface soil and groundwater samples, and providing data analysis of results.

Jason Grant, P.E.
Senior Project Manager

Mr. Grant is a senior project manager and environmental engineer with more than 19 years of environmental consulting experience. Mr. Grant has designed, managed, and implemented environmental investigations on a variety of project sites, including commercial/industrial facilities and research complexes, dry cleaning facilities, gas stations, electric substations, waterways, ports and harbors, lumber yards, and landfills.

11. Glossary and Other Descriptions

11.1 GLOSSARY

All Appropriate Inquiry (AAI) — that inquiry constituting "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice" as defined in CERCLA, 42 U.S.C §9601(35)(B), that will qualify a party to a commercial real estate transaction for one of threshold criteria for satisfying the LLPs to CERCLA liability (42 U.S.C §9601(35)(A) & (B), §9607(b)(3), §9607(q); and §9607(r)), assuming compliance with other elements of the defense.

Business Environmental Risk — a risk which can have a material environmental or environmentally-driven impact on the business associated with the current or planned use of a parcel of commercial real estate, not necessarily limited to those environmental issues required to be investigated in this practice. Consideration of business environmental risk issues may involve addressing one or more non-scope considerations.

Controlled Recognized Environmental Condition (CREC) – a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).

Data Gap — a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information. Data gaps may result from incompleteness in any of the activities required by this practice, including, but not limited to site reconnaissance (for example, an inability to conduct the site visit), and interviews (for example, an inability to interview the key site manager, regulatory officials, etc.).

De Minimis Conditions — conditions which do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be *de minimis* conditions are not recognized environmental conditions nor controlled recognized environmental conditions.

Environmental Professional — a person meeting the education, training, and experience requirements as set forth in 40 CFR §312.10(b).

Historical Recognized Environmental Condition (HREC) — a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).

Key Site Manager — the person identified by the owner or operator of a property as having good knowledge of the uses and physical characteristics of the property.

Material Threat —a physically observable or obvious threat which is reasonably likely to lead to a release that, in the opinion of the environmental professional, is threatening and might result in impact to public health or the environment. An example might include an aboveground storage tank system that contains a hazardous substance and which shows evidence of damage. The damage would represent a material threat if it is deemed serious enough that it may cause or contribute to tank integrity failure with a release of contents to the environment.

Orphan Site — (not ASTM E 1527-13 definition) — sites that could not be mapped due to poor or inadequate address information.

Recognized Environmental Condition (REC) — the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. *De minimis* conditions are not recognized environmental conditions.

11.2 DESCRIPTIONS OF DATABASES SEARCHED

Numerous regulatory databases were searched during this Phase I. Each database reviewed is described in the database report presented in Appendix D. Those databases required by the ASTM E 1527-13 Standard are identified below.

1. **NPL Sites:** The National Priorities List (NPL) is a list of contaminated sites that are considered the highest priority for cleanup by the U.S. Environmental Protection Agency (USEPA).
2. **Delisted NPL Sites:** The Delisted National Priorities List (NPL) is a list of formal NPL sites formerly considered the highest priority for cleanup by the USEPA that met the criteria of the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) for deletion from the NPL because a no further response was appropriate.
3. **CERCLIS Sites:** The Comprehensive Environmental Response, Compensation, and Liability Act Information System (CERCLIS) list identifies sites which are suspected to have contamination and require additional investigation to assess whether they should be considered for inclusion on the NPL.
4. **CERCLIS-NFRAP Sites:** CERCLIS-NFRAP status indicates that a site was once on the CERCLIS List but has No Further Response Actions Planned (NFRAP). Sites on the CERCLIS-NFRAP List were removed from the CERCLIS List in February 1995 because, after an initial investigation was performed, no contamination was found, contamination was removed quickly, or the contamination was not significant enough to warrant NPL status.
5. **Federal ERNS:** The Federal Emergency Response Notification System (ERNS) list tracks information on reported releases of oil and hazardous materials.
6. **RCRA non-CORRACTS TSD facilities:** The Resource Conservation and Recovery Act (RCRA) non-CORRACTS TSD Facilities List tracks facilities which treat, store, or dispose of hazardous waste and are not associated with corrective action activity.
7. **RCRA CORRACTS TSD facilities:** The RCRA CORRACTS TSD Facilities list catalogues facilities that treat, store, or dispose of hazardous waste and have been associated with corrective action activity.

8. **RCRA Generators:** The RCRA Generator list is maintained by the USEPA to track facilities that generate hazardous waste.

9. **Federal Institutional Controls/Engineering Controls:** The Federal Institutional Control list and Engineering Control list are maintained by the USEPA. Some Institutional Control and Engineering Control information may not be made publicly available and therefore will not be included on this registry.

10. **State and Tribal Equivalent CERCLIS Sites:** The (ASTM E 1527-13 Standard) requires searching "State and Tribal Equivalent NPL Sites." In California, the equivalent NPL is the RESPONSE database and the equivalent CERCLIS is the ENVIROSTOR database, which are maintained by the California Department of Toxic Substances Control (DTSC).

11. **State and Tribal Registered Storage Tanks:** In California, local regulatory agencies (e.g., County health departments and fire departments) and the State Water Resources Control Board (SWRCB) maintain lists of aboveground and underground storage tanks registered with those agencies (e.g., County health departments). For tribal property, the USEPA Region 9 maintains a list of underground storage tanks on Indian land.

12. **State and Tribal Landfills and Solid Waste Disposal Sites:** In California, the SWRCB in coordination with the Regional Water Quality Control Boards (RWQCB), and the Integrated Waste Management Board (IWMB) maintain lists of regulated waste disposal sites.

13. **State and Tribal Leaking Storage Tanks:** In California, the SWRCB in coordination with the RWQCBs maintains lists of Leaking Storage Tanks (LUST/LAST). The LUST/LAST lists are a listing of release sites that have an underground or aboveground storage tank listed as the source. For tribal property, the USEPA Region 9 maintains a list of leaking USTs on Indian land.

14. **State and Tribal Institutional Controls/Engineering Controls:** The USEPA maintains lists of sites with Institutional controls or Engineering controls in place. In addition, DTSC maintains a list of environmental deed restrictions.

15. **State and Tribal Voluntary Cleanup Sites:** In California, the DTSC, RWQCBs, and local regulatory agencies (e.g., County health departments) maintain lists of Voluntary Cleanup sites.

16. **State and Tribal Brownfield Sites:** In California, the DTSC maintains a list of Brownfield sites which includes any property where a redevelopment or re-use may be compromised by the presence or presumed presence of hazardous materials or petroleum.

17. Other site-specific relevant databases searched:

    - **CERS HAZ WASTE** - List of sites in the California Environmental Protection Agency (CalEPA) Regulated Site Portal which fall under the Hazardous Chemical Management, Hazardous Waste Onsite Treatment, Household Hazardous Waste Collection, Hazardous Waste Generator, and RCRA LQ HW Generator programs.
    - **SWEEPS UST** – The Statewide Environmental Evaluation and Planning System underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained.
    - **HIST UST** – Hazardous Substance Storage Container database is a historical listing of UST sites.

- **RCRA NonGen / NLR - RCRA** - Non Generators / No Longer Regulated. RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.
- **FINDS** – The Facility Index System contains both facility information and 'pointers' to other sources that contain more detail.
- **ECHO** – Enforcement & Compliance History Information. ECHO provides integrated compliance and enforcement information for about 800,000 regulated facilities nationwide.
- **CORTESE** – The CORTESE Hazardous Waste and Substances Sites list includes a list of public drinking water wells with detectable levels of contamination, hazardous substance sites selected for remedial action, sites with known toxic material identified through the abandoned site assessment program, sites with USTs having a reportable release, and all solid waste disposal facilities from which there is known migration. The sites on this list were those included on the SWRCB Leaking Underground Storage Tank (LUST) list, the IWMB Solid Waste Information System (SWF/LF, also referred to as (SWIS), and the DTSC Cal-Sites. The CORTESE listing is no longer updated.
- **HWTS** – Hazardous Waste Tracking System. DTSC maintains the Hazardous Waste Tracking System that stores ID number information since the early 1980s and manifest data since 1993. The system collects both manifest copies from the generator and destination facility.
- **HAZNET** – Facility and Manifest Data. Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.
- **HIST CORTESE** – Hazardous Waste & Substance Site List. The sites for the list are designated by the State Water Resources Control Board [LUST], the Integrated Waste Board [SWF/LS], and the Department of Toxic Substances Control [CALSITES]. This listing is no longer updated by the state agency.
- **NOTIFY 65 -** Notify 65 records contain facility notifications about any release that could impact drinking water and thereby expose the public to a potential health risk. The data comes from the SWRCB's Proposition 65 database.
- **WDS** – Waste Discharge System. Sites which have been issued waste discharge requirements.
- **CIWQS** – California Integrated Water Quality System. The California Integrated Water Quality System (CIWQS) is a computer system used by the State and Regional Water Quality Control Boards to track information about places of environmental interest,

manage permits and other orders, track inspections, and manage violations and enforcement activities.

- **CERS** - CalEPA Regulated Site Portal Data. The CalEPA Regulated Site Portal database combines data about environmentally regulated sites and facilities in California into a single database. It combines data from a variety of state and federal databases, and provides an overview of regulated activities across the spectrum of environmental programs for any given location in California. These activities include hazardous materials and waste, state and federal cleanups, impacted ground and surface waters, and toxic materials.

APPENDIX A
Limitations

APPENDIX A

Haley & Aldrich, Inc. Limitations

Environmental site assessment ("ESA") reports prepared by Haley & Aldrich, Inc. (Haley & Aldrich) are for the sole and exclusive use of its Client. Haley & Aldrich represents that the ESA was prepared in accordance with the ASTM International Standard E1527-13 entitled "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process" ("ASTM E 1527 13"). The findings, opinions, conclusions and information contained in the ASTM E 1527-13 ESA are limited to, and solely based upon, information reasonably ascertainable by Haley & Aldrich at the time the ASTM E 1527-13 ESA was completed.

All users of this ASTM E 1527-13 ESA are bound to the terms and conditions and limitations contained in the accompanying Proposal, Terms & Conditions, and Limitations for this ASTM E 1527-13 ESA. The findings, opinions, conclusions and information contained in this report are based solely on the Scope of Services provided pursuant to the Proposal and its attachments and the information reasonably ascertainable by Haley & Aldrich at the time the ASTM E 1527-13 ESA was completed. Haley & Aldrich has not performed any additional observations, investigations, studies, or other testing not specified in the Scope of Services. Haley & Aldrich shall not be liable for the existence of any condition the discovery of which would have required the performance of services not authorized under the Scope of Services.

This ASTM E 1527-13 ESA is prepared for the exclusive use of Haley & Aldrich's client in connection with the subject property for the purpose of assessing the potential or existing environmental contamination liabilities associated with the subject property. There are no intended beneficiaries other than Haley & Aldrich's client. Haley & Aldrich shall owe no duty whatsoever to any other person or entity by issuing the ASTM E 1527-13 ESA. Use of this ASTM E 1527-13 ESA by any person or entity, including by Haley & Aldrich's client, for a purpose other than for the purpose of assessing the potential or existing environmental contamination liabilities associated with the subject property is expressly prohibited unless such person or entity obtains written authorization from Haley & Aldrich indicating that the ASTM E 1527-13 ESA is adequate for such other use. Use of this ASTM E 1527-13 ESA by any person or entity for such other purpose without written authorization by Haley & Aldrich shall be at such person's or entity's sole risk and shall be without legal exposure or liability to Haley & Aldrich.

Haley & Aldrich may authorize third-party reliance on the ASTM E 1527-13 ESA by providing reliance letters to third party(ies) provided that the third party(ies) agree: (1) to use the ASTM E 1527-13 ESA only for the purpose of assessing the potential or existing environmental contamination liabilities associated with real property; (2) to be bound by the terms and conditions and limitations contained in the ASTM E 1527-13 ESA and the Proposal and its attachments, Terms & Conditions, and Limitations; (3) to accept the form and substance of Haley & Aldrich's reliance letter; and (4) to deliver to Haley & Aldrich a signed copy of a reliance letter by an authorized representative of the relying party, within thirty (30) days after said reliance letter is provided to the relying party, signifying the relying party's acceptance of the aforementioned conditions. Upon Haley & Aldrich's receipt of the signed reliance letter by the relying party(ies), the relying party(ies) will be authorized to rely on Haley & Aldrich's ASTM E 1527-13 ESA for the limited purpose of identifying potential or existing environmental contamination liabilities associated with the subject property. The relying party(ies) agrees to bind each of its respective successors and assigns to the aforementioned terms and conditions.

This ASTM E 1527-13 ESA reflects site conditions observed and described by records available to Haley & Aldrich as of the date of ASTM E 1527-13 ESA preparation. The passage of time may result in significant changes in site conditions, technology, or economic conditions, which could alter the findings and/or recommendations of the ASTM E 1527-13 ESA. Accordingly, Haley & Aldrich's client and any other party to whom the ASTM E 1527-13 ESA is provided recognize and agree that Haley & Aldrich shall bear no liability for deviations from observed conditions or available records after the time of ASTM E 1527-13 ESA preparation. Haley & Aldrich makes no express or implied representation that the information contained in the ASTM E 1527-13 ESA has continued viability after 180 days of the ASTM E 1527-13 ESA's completion date, and any use or reliance on the ASTM E 1527-13 ESA after 180 days of the ASTM E 1527-13 ESA's completion date by Haley & Aldrich's client or any other authorized person or entity will be at that party's sole risk and without liability to Haley & Aldrich.

Notwithstanding anything contained herein, Haley & Aldrich shall not be liable for any claim or damage arising from environmental contamination liabilities that occurred on the subject property after the effective date of the ASTM E 1527-13 ESA. Likewise, Haley & Aldrich shall not be liable for any existing or future property owner's failure to satisfy any continuing obligation for CERCLA liability protection or under the Federal Environmental Protection Agency's All Appropriate Inquiries rule.

CERTIFICATION

All hydrogeologic and geologic information, conclusions, and recommendations in this document regarding the AB&I Foundry Site have been prepared under the supervision of and reviewed by the certified professional whose signature appears below.

2/15/08

Jon Philipp, P.G., C.HG.
Senior Hydrogeologist
The Source Group, Inc.

1.0 INTRODUCTION

This report presents results of an investigation of the soil and groundwater conditions at the AB&I Foundry located at 7825 San Leandro Street in Oakland, California (Figure 1; Site). The report has been prepared by The Source Group, Inc. (SGI) on behalf AB&I Foundry (AB&I). The work was conducted in general accordance with the document titled, "Revised Site Investigation Work Plan" (Work Plan), prepared by SGI, dated September 17, 2007 (SGI 2007). The Work Plan was approved by the Alameda County Department of Environmental Health (ACEH) in a letter addressed to SGI, dated September 21, 2007.

The primary objective of the project is to obtain permanent Site closure following the removal of seven underground storage tanks (USTs) and a no further action (NFA) letter from the ACEH.

Since AB&I desires permanent closure and a NFA letter regarding activities associated with the prior UST removals, applicable regulations pertaining to permanent UST closure are defined in California Code of Regulations (CCRs), Title 23, Part 2672 (23 CCR 2672) and Title 23, Article 11. In order to receive a NFA, AB&I must demonstrate to the regulatory agency that appropriate corrective action has been taken pursuant to 23 CCR 2672.

One current method adopted and accepted by the agencies for granting an NFA is the use of the California Regional Water Quality Control Board – San Francisco Region (CRWQCB) risk-based screening approach. The CRWQCB risk-based screening approach was developed to provide a consistent decision-making process for the assessment of subsurface contamination based on the protection of human health and the environment.

Review of the available Site data suggests that the Site may be a candidate for "risk-based closure" following the CRWQCB guidelines for closing "low-risk" petroleum hydrocarbon release sites (CRWQCB 1996). Criteria to close low risk sites involves a demonstration that the source of contamination has been removed (i.e., the USTs), the site has been adequately characterized, substances remaining in soil or groundwater do not exceed maximum contaminant levels (MCLs) or other water quality objectives, a plume is not migrating into other sensitive receptors such as water wells or surface water bodies, and that the site does not present a risk to public health or the environment.

This report provides an evaluation of Site conditions and a demonstration that the Site meets the criteria for closure under the CRWQCB "low-risk" guidelines.

2.0 BACKGROUND

2.1 Site Description and History

The Site is located at 7825 San Leandro Street east of the intersection with 77th Avenue in a light industrial area of Oakland (Figures 1 and 2). The Site is bound by commercial/industrial properties to the north, south, east, and west. Union Pacific Railroad is located immediately adjacent to and west of the Site. Oakland Truck Stop is located immediately adjacent to and east of the Site. Elmhurst Creek is located along the southeast corner of the property (Figure 2). San Leandro Bay is located approximately one mile west of the Site.

AB&I has been operating at its present location since at least 1930 (BSK, 1993). Business activities include the manufacture of cast pipe and fittings. The facility accepts scrap iron and steel, which it stockpiles on-site, and uses during manufacturing activities. The Site encompasses an area of approximately 11.8 acres. The Site contains various warehouses, manufacturing and office buildings. The entire Site is covered with buildings and asphalt and concrete pavement. Seven underground storage tanks (USTs) were previously located on the Site. The USTs included one 8,000-gallon UST used for storing unleaded gasoline, one 8,000-gallon UST used for the storage of mineral spirits and later 1,1,1-trichloroethane (1,1,1-TCA), one 550-gallon UST used for storing regular leaded gasoline, one 10,000-gallon UST used for storing diesel, and three 10,000-gallon USTs used for storing gasoline.

A water supply well is located along southwest perimeter of the Site and is used in conjunction with East Bay Municipal District (EBMUD) water as a source for process (cooling) water associated with plant operations. In 1993, approximately 362,752 gallons per day (gpd) of well water and 12,000 gpd of EBMUD water was used for plant operations. Current well water use is approximately 15,000 gpd.

In 1989, a waste water treatment plant was installed to treat solids associated with process water. Excess water was discharged under a National Pollutant Discharge Elimination System (NPDES) permit issued by the California Regional Water Quality Control Board (CRWQB) in 1993. Prior to 1993, water was discharged to Elmhurst Creek in accordance with CRWQCB Order No. 88-090 (RWQCB 1993). In approximately 1995 or 1996, the treatment system was modified to recycle process water. Following the modifications in 1996, approximately 30,000 to 40,000 gpd of well water and 12,000 gpd of EBMUD water were used for plant operations.

In 2005, the treatment system was modified a second time to increase the volume of recycled water. The majority of water is currently recycled through the plant's waste water treatment system. Excess and non-recycled water is discharged to the sanitary sewer.

2.2 Hydrogeological Setting

The Site is located near the San Francisco Bay within an area identified as the East Bay Plain. The East Bay Plain is situated on the east side of the San Francisco Bay depression. The alluvial sediments of the East Bay Plain consist of a mixture of gravel, sand and clay deposited by coalescing alluvial fans. In the vicinity of the Site, fluvial and near shore deposits have been mapped (Helley et. al., 1979). The fluvial deposits are described as unconsolidated, moderately sorted, fine sand and silt, with clayey silt and occasional thin beds of coarse sand (Muir, 1993). The near-shore deposits are described as a well-sorted, fine to medium grained sand and silt, with lenses of sandy clay and clay. Regional groundwater flow in the vicinity of the Site is interpreted to be towards the west - southwest toward San Leandro Bay.

Although groundwater in the East Bay Plain is generally considered a potential future source of drinking water, there are no permitted drinking water wells within the Site vicinity (SFRWQCB, 1999), nor is the shallow groundwater in this area likely to be used as a public drinking water source in the foreseeable future. Surface water supplies from the Sierra Nevada provide the majority of the East Bay Plain's water supply, and a small amount of water is contributed by local runoff collected in reservoirs in the East Bay hills (SFRWQCB, 1999). Historical local (deep) groundwater production fields were abandoned in 1930. The Fitchburg groundwater supply well field located north and east of the Site operated from 1888-1930 (SFRWQCB, 1999). However, while municipal drinking water wells may have been abandoned, private and industrial wells still exist. Wells extracting groundwater located in the vicinity of the Site are used for irrigation and industrial purposes. Records of Alameda County Flood Control and Water Conservation District (ACFCWCD) and East Bay Municipal Utility District (EBMUD) indicate that nearly all wells in the East Bay Plain are used for "backyard", commercial irrigation, or industrial process water (99.6%) and municipal drinking water supply (0.4%).

The Site is currently underlain by a mixture of sandy/silty clay to a depth of at least 20-feet below ground surface (bgs). Groundwater has been encountered in borings and excavations at depths ranging from 8 to 12-feet bgs at the Site. Based on groundwater monitoring data from on-site monitoring wells for the period of 1993 through 2006, groundwater flows to the northeast and northwest (BSK, 2007). Groundwater hydraulic gradients have ranged from 0.002 to 0.012 feet per foot (ft/ft; BSK, 2007).

2.3 Previous Investigations

Various investigations have been conducted at the Site since 1991. Four of five investigations consisted of UST closure reports that were written as part of UST removals conducted at the Site between August 1991 and June 1992. The UST removal program included the removal of the seven USTs located on the Site. Four of the USTs were removed in the early 1990s and the three 10,000-gallon USTs were removed in 1987. The USTs removed included:

- Three 10,000-gallon USTs used for storing gasoline (removed 1982/1983);

- 8,000-gallon UST used for storing unleaded gasoline (removed 8/8/91);
- 550-gallon UST used for storing regular, leaded gasoline (removed 8/26/91);
- 8,000-gallon UST initially used for storing mineral spirits and later for storing 1,1,1-trichloroethane (removed 10/4/91); and
- 10,000-gallon UST used for storing diesel fuel (removed 6/3/92).

All of the tank removals, with the exception of the three former 10,000-gallon gasoline USTs were documented in UST closure reports. Selected data extracted from the UST closure reports are included in Appendix A. Information on the history of the three 10,000-gallon gasoline USTs was obtained from a review of historical aerial photographs from 1969, 1975, 1977, and 1983 obtained from Pacific Aerial Surveys, located in Oakland, California and from discussions with Mr. Dave Robinson (AB&I's Environmental Manager). A summary of the results of the previous tank closures and investigations follows.

Three 10,000-Gallon USTs Closure

Previous investigations conducted at the Site suggested that the three 10,000-gallon gasoline USTs were located within the building footprint of the Finished Goods Storage Area. A review of the aerial photographs and discussions with Mr. Dave Robinson indicate that the three 10,000-gallon USTs were not located within the vicinity of the Finished Goods Storage Area but were located adjacent to, and northeast of the Finished Goods Storage Area (Figure 2). A review of the aerial photographs and information provided by Mr. Dave Robinson revealed the following:

In the 1969 aerial photograph, two dispenser islands are located northeast of the Finished Goods Storage Area. Mr. Dave Robinson indicated that based on interviews with Mr. Frank Cole (former AB&I employee) the filling station was used for commercial purposes by the Olympic Oil Company and included two fuel dispensers and three 10,000-gallon gasoline USTs. In 1972, AB&I purchased the property containing the filling station. In 1977, the two fueling dispenser islands were removed and replaced by a single dispenser. All three USTs and the dispenser were reportedly removed in and around 1982/1983 (no longer depicted in the 1983 aerial photograph) by AB&I. The final disposition of the tanks is unknown. Mr. Frank Cole indicated that based on his recollection, the excavation was backfilled using soil generated from the removal of the USTs and imported soil. No confirmatory or UST closure samples were known to have been collected.

8,000-Gallon Gasoline UST Closure

Between August 5 and August 8, 1991, an 8,000-gallon gasoline UST and associated piping was removed under the oversight of Levine-Fricke Consultants (Levine-Fricke). Following the removal of the UST, approximately 20 cubic yards (CY) of soil were removed. Results of soil sampling conducted

following excavation activities indicate that remaining soil had concentrations of total petroleum hydrocarbons as gasoline (TPHg) less than 1 milligrams per kilogram (mg/kg), and no concentrations of benzene, toluene, ethylbenzene, and xylene (BTEX) were detected above laboratory reporting limits (ABI, 1991a).

550-Gallon Gasoline UST Closure

On August 26, 1991, a 550-gallon gasoline UST and associated piping were removed from the Site under the oversight of Levine-Fricke. On September 12, 1991, approximately 120 CY of TPHg-affected soil was removed in the area of the former tank. The excavation was terminated along the west and south sides of the former tank pit due to the presence of underground utilities and foundations.

Following excavation activities, soil samples were collected to define the extent of TPHg-affected soil that was left in place. TPHg was reported at concentrations of less than 0.52 mg/kg in soil samples collected along the northern and eastern perimeter of the excavation. TPHg was reported at concentrations of 100 mg/kg and 410 mg/kg in soil samples collected along the western and southern perimeter of the excavation (Levine-Fricke, 1992).

8,000-Gallon Mineral Spirits/1,1,1-TCA UST Closure

On October 4, 1991, excavation and removal of the 8,000-gallon mineral spirits/1,1,1-TCA UST was initiated. A total of approximately 180 CY of impacted soil was removed. The excavation was extended to 4-6 feet from the sides of the tank pit. During excavation activities, a three-inch layer of a tar-like substance was observed at a depth of 3.5 feet bgs along the northeast corner of the excavation. The tar-like substance was removed from portions of northeast corner and northern-most area of the excavation but due to difficulties in removing the concrete surface structures, excavation of the tar-like substance was terminated. As a result, the extent of the contamination was not determined. Soil samples collected by Levine-Fricke indicated that soil below and around the former tank pit was affected by relatively low concentrations of 1,1,1-TCA contamination (ABI, 1992a).

10,000-Gallon Diesel UST Closure

On June 3, 1992, a 10,000-gallon diesel UST was removed from the southern portion of the Site under the oversight of Levine-Fricke. As part of the UST removal, on June 4, 1992, approximately 180 CY of soil were removed. On June 5, 1992, the excavation was stopped due to the difficulty in removing a concrete surface (slab) and the relatively low levels of contamination observed by the Levine-Fricke's on-site geologist using a photo-ionization detector (PID; ABI, 1992b).

1993 Soil and Groundwater Assessment

In 1993, BSK installed four groundwater monitoring wells (MW-1 through MW-4) to comply with a request by the ACEH for a preliminary assessment of the areas surrounding each of the removed USTs (Figure 2). Quarterly groundwater monitoring conducted between the period of 1993 and 1997, revealed the presence of relatively low levels of petroleum hydrocarbons and chlorinated volatile organic compounds (CVOCs) in the groundwater in the vicinity of the former USTs.

2006 Soil and Groundwater Assessment

In July 2006, an additional soil and groundwater assessment was conducted as part of a property transfer. Groundwater samples were collected from each of the existing monitoring wells (MW-1, MW-3, and MW-4) and submitted for chemical analysis for polycyclic aromatic hydrocarbons (PAHs) using EPA Method 8270C, TPHg and total petroleum hydrocarbons as diesel (TPHd) using EPA Method 8015M as well as BTEX using EPA Method 8020. All samples were also analyzed for VOCs including fuel oxygenates, using EPA Method 8260B. Well MW-2 was found to be damaged beyond repair, and therefore was not sampled. On August 13, 2006 monitoring well MW-2, was abandoned (BSK, 2007).

On August 12, 13, and 18, 2006, six new groundwater monitoring wells (MW-2R, and MW-5 through MW-9) were installed. The wells were constructed with schedule 40, 2-inch diameter, polyvinyl chloride (PVC) casing. Between the period of August 17 and August 23, 2006, water levels were measured and groundwater samples were collected from the three existing and six new monitoring wells. One groundwater sample from each of the previously existing wells (MW-1, MW-3, and MW-4) was analyzed for PAHs. Groundwater samples from the six newly installed wells (MW-2R, MW-5, MW-6, MW-7, MW-8 and MW-9) were submitted for chemical analysis for TPHg and TPHd, BTEX, VOCs including fuel oxygenates, and PAHs. In addition, soil samples were collected at various depth intervals during the installation of monitoring wells MW-5, MW-6, MW-7, and MW-8 and were analyzed for metals and VOCs using EPA Methods 6020 and EPA Method 8260B, respectively.

Results of the July/August 2006 sampling event for all nine wells indicated that five of the nine wells had concentrations of at least one compound that exceeded their respective U.S. Environmental Protection Agency (USEPA) maximum contaminant level (MCL) or California Regional Water Quality Control Board – San Francisco Bay Region (CRWQCB-SF) Environmental Screening Levels (ESLs; BSK, 2007). Historical groundwater quality data is presented in Appendix A.

On September 14, 2006, ACEH issued a letter to AB&I requesting a work plan to:

- define the extent soil and groundwater contamination in the vicinity of the former 550 gallon gasoline UST and 1,1,1-TCA UST;
- evaluate elevated concentrations of lead reported in Site groundwater;
- sample Site groundwater monitoring wells; and

- evaluate the hydraulic gradient and flow direction.

On July 9, 2007, SGI submitted a Work Plan to ACEH to address the issues listed above. On July 26, 2007, ACEH issued a letter requesting a revised work plan to:

- Provide additional details regarding characterization of soil and groundwater in the vicinity of the former 550-gallon gasoline UST. Specifically, ACEH requested that the central boring in the UST area be advanced to a minimum of 30-feet bgs to characterize the vertical extent of petroleum-impacted soil. In addition, five borings locations were recommended by ACEH in order to characterize the horizontal and vertical extent of petroleum impacted soil and groundwater at the former UST location.

- Include the advancement of additional borings along transects downgradient of the former 8,000 gallon 1,1,1-TCA UST to better define the extent and direction of plume migration.

- Conduct an additional investigation in the area of the former 10,000-gallon diesel UST and monitoring well MW-7.

- Provide additional details regarding the removal of the three former 10,000-gallon USTs in the Finished Goods Area.

- Provide clarification of sampling methods and analyses for the proposed sampling location in the southeast corner of the Shipping Yard Area.

- Expand the discussion regarding which soil samples will be analyzed for metals.

- Provide additional information on the construction details and estimated historical and current daily volume of water extracted from the on-site water supply well in addition to a description of future plans for the operation of the well.

- Conduct quarterly groundwater sampling and reporting of existing monitoring wells.

- Provide a more detailed site map that illustrates the location of all proposed sampling locations.

On September 17, 2007, SGI submitted a revised Work Plan (Revised Work Plan) to ACEH. The Revised Work Plan was approved by ACEH in a letter dated September 21, 2007.

3.0 INVESTIGATION OBJECTIVES AND SCOPE OF WORK

The primary objective of the project is to obtain permanent Site closure following the removal of seven USTs and a no further action (NFA) letter from the ACEH. One current method adopted and accepted by the agencies for granting an NFA is the use of the CRWQCB's risk-based screening approach. The CRWQCB's risk-based screening approach was developed to provide a consistent decision-making process for the assessment. Detected chemical concentrations in soil gas, soil, and groundwater were compared to corresponding CRWQCB ESLs. The presence of a chemical in soil or groundwater at concentrations below its corresponding ESL can be assumed to not pose a significant threat to human health and the environment. If a chemical is present at concentrations above its corresponding ESL, then additional evaluation or further action may be necessary.

To achieve the objective described above, this investigation was conducted for the purpose of filling in data gaps associated with previous investigations conducted at the Site and to further delineate the extent of petroleum hydrocarbon and VOC contamination in soil and groundwater underlying the Site. The investigation addressed concerns outlined by ACEH in their letters to AB&I, dated September 14, 2006 and July 26, 2007 (ACEH, 2006, 2007). The investigation also addressed data gaps identified by SGI during the review of Site information.

Based on the review of data from previous investigations the following areas of concern (AOCs) were identified:

- Former Three 10,000-Gallon USTs Area
- Former 550-Gallon Gasoline UST Area
- Former 8,000-Gallon Mineral Spirits/1,1,1-TCA UST Area
- Parking Lot Area
- Former 10,000-Gallon Diesel UST Area

The location of the AOCs is shown in Figure 2.

Based on the results of the previous investigations, SGI developed and implemented the following scope of work as described in the Revised Work Plan (SGI, 2007b):

- Obtained drilling permits from the County of Alameda,
- Notified Underground Service Alert (USA) to check for underground utilities in the vicinity of the soil boring locations,
- Collection of soil gas samples from 10 locations on the Site,

- Drilled and sampled 37 soil borings to assess the source and extent of VOC and TPH-affected soil and groundwater,
- Sampled nine monitoring wells located on the Site,
- Conducted natural attenuation monitoring, and
- Prepared this report.

4.0 INVESTIGATION ACTIVITIES

Investigation activities included the collection of soil gas samples from 10 locations, the advancement of 37 borings (SB-1 through SB-37) using direct push technology (DPT) to further assess the presence of VOC and TPH-affected soil and groundwater onsite, and the sampling of nine monitoring wells located on the Site (Figure 3).

4.1 Permitting and Prefield

Prior to initiating fieldwork a soil boring permit was obtained from the Alameda County Public Works Department. A copy of the permit is included in Appendix B. USA was also notified to mark utilities.

4.2 Soil Gas Survey

On November 2, 2007, soil gas samples were collected from 10 locations at the Site to assess potential vapor intrusion into indoor and ambient air. Samples were collected in the vicinity of the 550 gallon UST area, the 8,000-gallon 1,1,1 mineral spirits/TCA UST area, the three 10,000 gallon USTs area, and well MW-9 area (Figure 3). Vironex, Inc. (Vironex) collected soil gas samples from a depth of 5-feet utilizing a hydraulically-driven probe equipped with detachable drive points. Once the drive point reached the target sample depth, the drive point was retracted to provide a void space where soil gas could accumulate. Hydrated bentonite pellets were then placed around the drive rod at the ground surface to prevent ambient air intrusion during purging and sampling. Polyethylene tubing connected to the soil gas sampling tip was attached to the vacuum system to purge the line. Approximately two tubing volumes of air were purged at a flow rate of 100 milliliters (ml) per minute.

Soil gas samples were originally planned to be analyzed in the field using an onsite mobile laboratory, but due to laboratory equipment malfunctions soil gas samples were collected into 1-liter Summa^{tm} canisters and submitted to a stationary laboratory. To collect the soil gas sample, Summa^{tm} canisters were placed in-line to maintain a flow rate of less than 100 ml per minute while collecting soil gas samples. Samples were then labeled and transported under chain-of-custody (COC) procedures to Air Toxics Laboratories located in Folsom, California and analyzed for VOCs using EPA Method 8260B. Following each sample collection, all tubing was discarded and the drive point rod was decontaminated. Soil gas sample locations are shown on Figure 3.

4.3 Soil Borings

Soil borings were advanced on-Site to allow the collection of soil samples for the purpose of chemical analysis, lithologic characterization, and delineation of the extent and magnitude of contamination in the vicinity of the former UST areas. A total of 31 soil borings were advanced during the week of November 4 through November 9, 2007. Six additional borings were advanced in the area of the parking lot and

along the eastern boundary of the Site on November 26 and 27, 2007 to further assess the lateral extent of VOC-affected groundwater. Soil borings consisted of dual wall DPT and macrocore DPT borings. Soil borings were advanced in the following areas:

Former Three 10,000-Gallon USTs Area

A total of eight borings (SB-1 through SB-5 and SB-7 through SB-9) were advanced in the vicinity of the three former 10,000-gallon USTs. Soil samples were collected from seven of the borings and grab groundwater samples were collected from four borings. Soil samples were analyzed for TPHg, TPHd, and BTEX. In addition, two soil samples were analyzed for CAM 17 metals (arsenic, barium, beryllium, chromium, cobalt, copper, lead, molybdenum, nickel, vanadium, zinc, and mercury). Groundwater samples were analyzed for TPHg, BTEX, VOCs, fuel oxygenates (methyl-tert butyl alcohol [MTBE], tert-amyl methyl ether [TAME], tert butyl alcohol [TBA], diisopropyl ether [DIPE], and ethyl tert butyl ether [ETBE]), and TPHd.

In addition, two borings (SB-6 and SB-37) were advanced along the eastern perimeter of the Site to investigate the presence of potential offsite source(s) of contamination. Grab groundwater samples were collected from both borings and analyzed for TPHg, TPHd, and VOCs, including fuel oxygenates.

Former 550-Gallon Gasoline UST Area

A total of six borings (SB-10 through SB-15) were advanced in the vicinity of the former 550-gallon gasoline UST. Twenty-three soil samples and two grab groundwater samples were collected. Soil samples were analyzed for TPHg, and BTEX. In addition, two of the twenty-three soil samples were analyzed for CAM 17 metals. Groundwater samples were analyzed for TPHg, TPHd, and VOCs including fuel oxygenates.

Parking Lot Area

A total of 12 borings (SB-16 through SB-21 and SB-31 through SB-36) were advanced in the parking lot area. Ten grab groundwater samples were collected and analyzed for TPHg, TPHd, and VOCs including fuel oxygenates. Due to slow recharge no groundwater samples were collected from borings SB-21 and SB-31. Groundwater samples collected from borings SB-32 through SB-36 were only analyzed for VOCs.

Former 8,000-Gallon Mineral Spirits/1,1,1-TCA UST Area

A total of five borings (SB-22 through SB-26) were advanced in the location of former 8,000-gallon mineral spirits/1,1,1-TCA UST. Fifteen soil samples and three grab groundwater samples were collected. Soil samples were analyzed for TPHg, TPHd, and VOCs including fuel oxygenates. Six of the fifteen soil samples were also analyzed for CAM 17 metals. In addition, three soil samples collected from boring SB-26 were analyzed for PAHs. Grab groundwater samples were analyzed for TPHg, TPHd, and VOCs including fuel oxygenates.

Former 10,000-gallon Diesel UST

A total of four borings (SB-27 through SB-30) were advanced in the location of the former 10,000-gallon Diesel UST. Eleven soil samples and three grab groundwater samples were collected. Soil samples were analyzed for VOCs and TPHd. Select soil samples were also analyzed for TPHg and fuel oxygenates. In addition, two of the eleven soil samples were analyzed for CAM 17 metals. Grab groundwater samples were analyzed for TPHg, TPHd, and VOCs including fuel oxygenates.

4.4 Soil and Groundwater Sampling Procedures

Soil samples were collected continuously to a maximum depth of 25-feet bgs using Vironex's dual tube or macrocore geoprobe sampling system. Where soil samples were collected, dual-wall DPT borings were advanced. For borings in which only grab groundwater samples were collected, macrocore DPT borings were advanced. Soil samples were collected in five-foot long sections of clear, acetate sleeves. Four to six - inch long sections of the sleeves were cut using a hack saw at selected depths for logging and chemical analyses. All soil samples were logged according to Unified Soil Classification System (USCS), including color, moisture content, mottling, and presence of staining or odors. In addition, approximately 20 grams of soil from every 5-foot boring core was screened in the field for VOCs using an organic vapor monitor (OVM). Boring logs are included as Appendix C.

Soil samples submitted for chemical analysis were covered with Teflon sheets, capped, labeled and placed on ice for transport following chain-of-custody procedures to Test America Laboratories (TAL) located in Pleasanton, California.

To collect grab groundwater samples, a small diameter temporary polyvinyl chloride (PVC) well screen was inserted into the borehole. Groundwater samples were collected by placing a polyethylene tube with a bottom check valve into the screen and sampling through the tubing. Samples were decanted into laboratory provided containers. Groundwater samples were collected on-site from first encountered groundwater. Immediately following, all borings were grouted with neat cement from the bottom up using a tremmie pipe.

Groundwater samples submitted for chemical analysis were capped with Teflon septa, labeled, and placed on ice for transport to the analytical laboratory for analysis under chain-of-custody procedures.

4.5 Chemical Analyses

Soil and groundwater samples were analyzed using the following methods:

- VOCs,TPHg, and fuel oxygenates using EPA Method 8260B; and
- TPHd using EPA Method 8015M with silica gel cleanup.

Selected soil samples were also analyzed for:

- CAM 17 Metals using EPA Methods 6010B/7471, and;
- PAHs using EPA Method 8270C.

4.6 Groundwater Monitoring Well Sampling

In addition to grab groundwater samples, all nine monitoring wells were sampled on October 24 and October 25, 2007 as part of this investigation. Monitoring wells were purged and sampled using low-flow (i.e., low stress) procedures. Purging and sampling was performed using a peristaltic pump with dedicated tubing. Groundwater samples submitted for chemical analysis were capped with Teflon septa, labeled, and placed on ice for transport to the analytical laboratory for analysis under chain-of-custody procedures. Groundwater samples were analyzed for TPHg, VOCs, fuel oxygenates using EPA Method 8260B and dissolved lead using EPA Method 6010B. In addition, all groundwater samples were analyzed for TPHd using EPA Method 8015M with silica gel cleanup.

In addition to analyses listed above, groundwater samples were analyzed for geochemical indicator parameters. Geochemical indicator parameters include general environmental parameters, electron acceptor/donor constituents, and by-products of these constituents that may be generated in the subsurface as a consequence of microbiological activity. The following geochemical parameters were measured in the groundwater samples:

- Dissolved manganese;
- Ferrous iron;
- Nitrate;
- Sulfate;
- Chloride;
- Volatile organic acids; (e.g., acetic, butyric, lactic, propionic, and pyruvic acids);
- Dissolved methane / ethane / ethene; and
- Alkalinity.

Field indicator parameters for the wells were measured using a water quality meter equipped with a flow-through cell and multi-meter capable of measuring dissolved oxygen (DO), turbidity, oxidizing-reducing potential (ORP), conductivity, pH, and temperature. The field meters were calibrated daily according to the manufacturer's instructions. Copies of field groundwater sampling forms are included in Appendix D.

4.7 Equipment Decontamination

Disposable soil sampling equipment, such as small tools and disposable gloves, were decontaminated or disposed of after each use. The decontamination procedure consisted of:

- Wash in a phosphate-free soap and water mixture;
- Rinse thoroughly in distilled water following washing; and
- Final rinse using distilled water.

Decontamination of larger drilling equipment was conducted using a steam cleaner supplied by Vironex.

4.8 Waste Management

Soil cuttings, well purge water, and decon water generated during the soil and groundwater sampling were stored on the Site in properly labeled containers. Investigative derived waste (IDW) will be disposed of properly following profiling of the waste.

5.0 INVESTIGATION RESULTS

5.1 Soil Lithology

Soil encountered during this investigation consisted primarily of clay with thin interbeds of silt and silty sand. In borings advanced in the location of the former three 10,000-gallon USTs, a gravel layer was observed at approximately 21-feet bgs. Geologic cross sections are illustrated in Figures 4 and 5. A cross section location map is presented in Figure 3.

5.2 Groundwater Flow and Gradient

On October 24, 2007, the depth to groundwater was measured in monitoring wells MW-1 through MW-9. The depth to groundwater ranged from approximately 4.27 feet below top of casing (btoc) in MW-9 to 9.08 feet btoc in MW-6. The water level elevation in each well was calculated by subtracting the depth-to-water measurements from the top of casing elevations. The measured depths to water and the calculated water level elevations are summarized in Table 1.

The groundwater elevations were used to calculate the groundwater gradient and flow direction. Based on the groundwater elevation contours, groundwater is generally flowing towards the northwest along the east-central portion of the Site with groundwater movement to the north in the west-central portion of the Site. The magnitude of the lateral hydraulic (groundwater) gradient was approximately 0.005 ft/ft. A potentiometric surface map for October 2007 is presented as Figure 6.

5.3 Soil Gas, Soil, and Groundwater Results

5.3.1 Soil Gas Results

Soil gas samples were collected from 10 locations by Vironex on November 2, 2007. Of the ten samples collected, three of the samples did not report concentrations of any EPA Method 8260 target list compound above the laboratory reporting limit. Of the seven remaining samples, concentrations of chloroethane, BTEX, and tetrachloroethene (PCE) were detected. Chloroethane was detected in one sample collected north of the location of the former mineral spirits/1,1,1-TCA UST at a concentration of 0.2 micrograms per liter (µg/l). BTEX constituents were detected in the greatest number of samples in the area of the former 550-gallon gasoline UST. PCE was detected in only one sample (SG-4) located east of the Main Office Building at a concentration of 0.12 µg/l. Soil gas sample results are summarized in Table 2 and shown on Figure 7. Laboratory chemical analysis reports are included in Appendix E.

5.3.2 Soil Analytical Results - Organics

Organic chemicals or parameters detected in soil at concentrations above laboratory reporting limits included TPHg, TPHd, chloroethane, ethylbenzene, toluene, and xylenes. Soil samples results are listed in Table 3 and shown on Figures 8 through 11. Selected soil quality data is also shown on cross sections A-A' and B-B' presented in Figures 4 and 5, respectively. Laboratory chemical analysis reports are included in Appendix E.

Former Three 10,000-Gallon USTs Area

Twenty-five soil samples were collected from the Former Three 10,000-gallon USTs Area. TPHg and TPHd, along with trace concentrations of ethylbenzene were detected in soil samples collected in the vicinity and downgradient of the three former 10,000-gallon USTs. Concentrations of all three compounds in the vicinity of the USTs suggest that a leak in one or more USTs has occurred. Soil contamination appears to be confined to the upper 20 feet of soil as the deeper samples had low concentrations (less than 0.5 mg/kg) of each compound. Low concentrations of contaminants found in samples collected in the vicinity of the UST area suggest that excavation activities were effective in removing the majority of the contaminated soil in the area of the former USTs. Soil sample results for the Former Three 10,000-Gallon UST Area are shown on Figure 8.

Former 550-Gallon Gasoline UST Area

Twenty-three soil samples were collected from the Former 550-Gallon Gasoline UST Area. Based on soil samples collected from within and around the area of the former UST, there appears to have been a leak from the UST. The excavation of soil adjacent to the UST appears to have been effective in removing the bulk of the contaminated soil. TPHg was not detected in soil samples collected within the tank backfill soil. In addition, soil samples collected from borings located outside of the excavated area reported low concentrations of TPHg. Only one sample, collected from boring SB-15 located north of the excavated area at a depth of 15-feet bgs, reported higher concentrations of TPHg. TPHg-impacted soil in the vicinity of the fuel dispenser island appears confined to depths shallower than 15-feet bgs. Samples collected at deeper depths exhibited low or non-detectable concentrations of TPHg. Soil sample results for the Former 550-Fallon UST Area are shown on Figure 9.

Former 8,000-Gallon Mineral Spirits/1,1,1-TCA UST Area

Fifteen soil samples were collected from the Former 8,000-Gallon Mineral Spirits/1,1,1-TCA UST Area. Soil samples collected from the former UST area had detectable concentrations of TPHg and TPHd. Soil samples collected in deeper soil (greater than 10 feet bgs) did not report any compounds above the laboratory reporting limits indicating that contamination is confined to the upper 10-feet. Concentrations of TPHg and TPHd detected in soil samples collected from borings located north and east of the excavated were generally low indicating that soil north and east of the tank area is relatively unimpacted

with petroleum hydrocarbons. Concentrations of TPHg and TPHd were greatest in soil samples collected west of the UST area at a depth of 4-feet bgs, corresponding to the tar material observed in this area. Soil data from samples collected within the vicinity of the former UST suggests that excavation activities were effective in removing the majority of the contaminated soil in the area of the former UST. Soil samples results for the former 8,000-gallon UST area are shown on Figure 10.

Three soil samples collected from boring SB-26 at depths of 4, 10, and 15 feet bgs were also analyzed for PAHs using EPA Method 8270C. The sample collected at 4 feet bgs was the tar material previously reported during the UST removal. This tar-like material is interpreted by SGI to be the same material used to coat new manufactured product pipes in the production area. According to Mr. Dave Robinson, this tar-like material most likely was deposited on the ground prior to the paving of the production area. Sixteen PAHs were reported in the 4 foot sample of the tar material. The concentrations of the PAHs appear to attenuate rapidly with depth. Concentrations of PAHs in samples collected from the 10 and 15 foot depth intervals were low (less than 1 mg/kg). This tar-like material was not observed in adjacent borings located to the east (SB-22) or to the north (SB-24). PAH results are summarized in Table 4.

In addition, PAHs were analyzed during the August 2006 groundwater sampling event conducted by BSK (BSK, 2007). No PAHs were reported in any of the groundwater monitoring wells including MW-2R located in the immediate vicinity of boring SB-26 (Figure 10). The absence of PAHs in groundwater in the vicinity of the mineral spirits/1,1,1-TCA UST indicates that PAHs have not impacted groundwater.

Former 10,000-Gallon Diesel UST Area

Eleven soil samples were collected from the Former 10,000-Gallon Diesel UST Area. TPHd was only detected in shallow (less than 10-feet bgs) samples collected in the area of the former 10,000-gallon diesel UST. No TPHd was detected in soil samples collected at depth greater than 10-feet bgs. TPHd was reported in samples collected from outside the excavated. However, all concentrations of TPHd were low (less than 150 mg/kg). Soil data from samples collected within the vicinity of the former UST suggests that excavation activities were effective in removing the majority of the contaminated soil in the area of the former UST. Soil sample results for the former 10,000-gallon UST area are shown on Figure 11.

5.3.3 Soil Analytical Results - Metals

In addition to the analyses performed above, 12 soil samples were analyzed for CAM 17 metals. Soil samples selected for metal analyses included samples collected at each of the UST areas from fill (excavated areas and at depths of less than 5 feet bgs) and native soils (samples collected outside of excavated areas and depths greater than 5 feet bgs). All CAM 17 metals were detected in at least one or more samples. The most prevalent metals detected were arsenic, barium, chromium, cobalt, copper, lead, nickel, vanadium, and zinc, which were detected in all 12 soil samples. Concentrations of metals

were generally observed to be higher in samples collected from shallower depths and lower in samples collected from deeper depths. For example, chromium and lead were detected in boring SB-26 at concentrations of 130 and 240 mg/kg, respectively at a depth of 4-feet bgs, and at a concentration of 53 and 34 mg/kg, respectively in the sample collected at 10 feet bgs

CAM 17 metal concentrations were compared with regional background metal concentrations to differentiate between metal concentrations present in samples due to ambient conditions and those present as a result of site–related activities. Background metal concentrations were obtained from data presented in the Soil Management Plan prepared as part of the Lawrence Berkeley National Laboratory (LBNL) Environmental Restoration Program (LBNL, 2006). Of the compounds detected in samples at the Site, beryllium, chromium, copper, lead, mercury, selenium, thallium, vanadium, and zinc were reported at concentrations in excess of the background levels published by LBNL. In addition, those metals which were detected above their background levels appear confined to five samples, three of which were collected at a depth of less than 6 feet bgs. The two remaining samples were collected at 10 feet. However, both samples were collected within backfill associated with the removal of the USTs. Therefore, the five samples that exceed the LBNL background levels are most likely due to imported fill and not due to Site-related activities.

A complete list of analytical results for metal concentration in soil samples along with the LBNL background levels can be found in Table 5.

5.3.4 Groundwater Analytical Results

Grab groundwater samples were collected from 24 borings and analyzed for VOCs, TPHg, and BTEX using EPA Method 8260B. In addition, select samples were also analyzed for TPHd using EPA Method 8015M with silica gel cleanup.

The nine monitoring wells located on the Site were also sampled as part of this investigation. Groundwater samples were analyzed for TPHd, VOCs, TPHg, BTEX, fuel oxygenates, dissolved lead, and geochemical indicator parameters. Groundwater sample results are presented in Table 6 and shown on Figures 12 and 13. Laboratory chemical analysis reports are included in Appendix E.

Former Three 10,000-Gallon USTs Area

Five grab groundwater samples were collected from the area of former three 10,000-Gallon USTs. Groundwater underlying and south-southwest of the former USTs is impacted with TPHg, BTEX, and TPHd. In addition, a low concentration (2.1ug/L) of trichloroethene (TCE) was reported in the sample from boring SB-9 (Figure 13). The source of the TCE is unknown, however its presence in this sample may be due to lab error or related to an off-site source. The highest concentrations of TPHg, BTEX, and TPHd were reported in samples collected from within the warehouse, which is located south-southwest of

the tank area (Figure 12). Higher concentrations of TPHg, BTEX, and TPHd in samples collected downgradient of the UST area suggest than excavation of the source area during the removal of the USTs was effective in reducing the source of contaminants to groundwater.

TPHd and toluene were also reported in samples collected from boring SB-6 at concentrations of 110 ug/L, and 0.52 ug/L, respectively. In addition MTBE was reported in boring SB-37 (primary and duplicate sample) at concentrations of 9.1ug/L and 11 ug/L, respectively. Borings SB-6 and SB-37 are located along the eastern Site boundary (Figure 12). The Oakland Truck Stop site is located immediately adjacent to and east of the Site. Soil borings SB-6 and SB-37 are located hydrologically downgradient of the Oakland Truck Stop site. The presence of TPHd, toluene, and MTBE reported in samples collected from theses borings is interpreted to be associated with releases from the Oakland Truck Stop site.

Former 550-Gallon Gasoline UST Area

Two grab groundwater samples were collected from the area of the former 550-Gallon Gasoline UST. Groundwater in the vicinity of the UST is impacted with TPHg, TPHd, and BTEX. Grab groundwater samples collected from outside the excavated area (SB-12) had higher concentrations of all three compounds than the sample collected from within the excavated area (MW-4). However, due to the presence of suspended sediments in grab groundwater samples, concentrations of contaminants in these samples are interpreted to be biased high. This suggests source removal in the immediate vicinity of the UST has been effective in reducing dissolved impacts to groundwater. Figure 12 presents the TPHg, TPHd, and BTEX results for groundwater samples.

Parking Lot Area

Eleven grab groundwater samples were collected from the Parking Lot Area. Groundwater underlying the Parking Lot Area is primarily impacted by CVOCs with relatively low concentrations of BTEX and TPHd. Elevated concentrations of 1,1,1-TCA and its daughter products 1,1-DCA, 1,1-DCE, cis 1,2-DCE, chloroethane, vinyl chloride (CVOCs) are present in groundwater underlying the Parking Lot Area (Figure 13). The highest concentrations of CVOCs were detected in samples collected along the eastern portion of the parking lot near well MW-8. Elevated concentrations of CVOCs were detected in samples collected to the west of well MW-8. However, concentrations of all compounds appear to diminish near the eastern and northern perimeters of the parking lot. Concentrations for all CVOCs were not detected in the groundwater sample collected north of well MW-3 (SB-34) near the fence and in the sample collected immediately west of the Site (Figure 13).

The source of the CVOCs is interpreted to be associated with releases of 1,1,1-TCA from the mineral spirits/1,1,1-TCA UST. CVOCs have migrated from the UST area to the Parking Lot Area. Petroleum compounds are generally heavier and less mobile and therefore, are not expected to migrate in the same manner as CVOCs. The absence of significant concentrations of petroleum hydrocarbons in the parking

lot area has resulted in slower bio-degradation of the CVOCs. However, the presence of 1,1,1-TCA and its daughter products suggests that reductive dechlorination is occurring downgradient of the mineral spirits/1,1,1-TCA UST source area within the Parking Lot Area (Figure 13). A more detailed discussion of natural attenuation and reductive dechlorination at the Site is presented in section 5.3.6.

Former 8,000-Gallon Mineral Spirits/1,1,1-TCA UST Area

Three grab groundwater samples were collected from the former 8,000-Gallon Mineral Spirits/TCA UST Area. Groundwater underlying the former UST area is impacted with TPHg, BTEX, and TPHd. The highest concentrations of TPHd were reported in sample SB-26 collected near the production area located west and downgradient of the UST. Previous investigations have reported the presence of CVOCs in the immediate vicinity of the UST. As previously discussed the UST was initially used for the storage of mineral spirits and later for 1,1,1-TCA. The presence of TPHg, TPHd, and BTEX and absence of CVOCs reported during this investigation suggest that a release of mineral spirits has occurred followed later by a release of 1,1,1-TCA. Bio-degradation of 1,1,1-TCA and other CVOCs appears to be occurring related to the presence of petroleum hydrocarbons in the source area.

Former 10,000-Gallon Diesel UST Area

Three grab groundwater samples were collected from the former 10,000-Gallon Diesel UST Area. Groundwater underlying the area of the former UST is impacted with TPHd, toluene, and xylene. The highest concentrations of TPHd were reported in samples collected from well MW-1 located to the south of the former UST. Concentrations of TPHd show a marked reduction in samples collected to the northwest of the UST area. Concentrations of TPHd were reported in the sample collected from well MW-7 so it is likely that TPHd is present in groundwater west of the well. However, concentrations of TPHd in all samples were generally low (less than 500 µg/l, Figure 12).

Dissolved Lead

Lead was reported in groundwater samples obtained from well MW-4 during the March 1993 and December 1994 monitoring events at concentrations of 59 and 86 ug/L, respectively. During this sampling event, none of the samples collected from monitoring wells MW-1 through MW-9 had concentrations of dissolved lead above the laboratory's reporting limit of 5 ug/L. The presence of lead reported in previous samples collected in 1993 and 1994 may be the result of suspended sediments present in the samples.

5.3.5 Natural Attenuation Monitoring

In addition to the analyses described above, groundwater samples collected from all nine monitoring wells were analyzed for geochemical parameters for the purpose of providing evidence documenting the natural attenuation of CVOCs and petroleum hydrocarbons that remain in Site groundwater.

Natural attenuation is the process whereby natural processes, which include biodegradation, dispersion, dilution, volatilization, hydrolysis, and sorption, result in the reduction of constituents of concern. For petroleum hydrocarbons and CVOCs, biodegradation is considered to be the primary mechanism by which the solute mass is removed. Two lines of evidence were used to evaluate whether natural attenuation processes are effectively remediating the chlorinated VOC plume. The two lines of evidence include:

- Documented reduction of contaminant mass at the Site. This is determined by monitoring for breakdown of released chlorinated hydrocarbons, and/or accumulation of by-products of degradation; and
- Presence and distribution of geochemical and biochemical indicators of natural attenuation.

5.3.5.1 Trends of Individual VOC Data

First lines of evidence of natural attenuation processes include the documented reduction of contaminant mass at the site. This is determined by monitoring for the breakdown of released VOCs, and/or accumulation of by-products of degradation. For this assessment, groundwater results collected by SGI during the October 2007 investigation were compared to historical groundwater results collected by BSK. Historical groundwater data was available from March 1993 through July 2006 for wells MW-1 through MW-4. Well MW-2R was installed to replace well MW-2 in August 2006 due to damage sustained to the wellhead. Well MW-2R is located adjacent to the location of former well MW-2 and is screened at approximately the same interval. Therefore, current data from well MW-2R was used with historical data obtained from well MW-2 for this evaluation. In addition to well MW-2R, wells MW-5 through MW-9 were also installed in August 2006. Therefore, historical data for wells MW-5 through MW-9 is comprised of data collected following the installation of the wells in August 2006 and data collected during this investigation. Historical groundwater quality data is included in Appendix A.

Historical groundwater data indicates that VOC concentrations in groundwater underlying the Site have steadily decreased since monitoring began in 1993. Data from monitoring well MW-2 indicate that VOC concentrations have generally declined since monitoring was initiated in March 1993. Concentrations of both vinyl chloride and 1,1,1-TCA decreased in well MW-2 from a high of 6.7ug/L reported during the March 1993 sampling event to 0.8 ug/L reported during the June 1994 sampling event. Since the September 1994 sampling event, concentrations of both compounds have remained below laboratory reporting limits. Chloroethane was detected at an historical high concentration of 5 ug/L during the March 1993 sampling event in well MW-2 but concentrations have declined steadily during the eight

subsequent sampling events. Since the September 1995 sampling event, concentrations of chloroethane in well MW-2 have remained below laboratory reporting limits. Additional reductions in chlorinated VOC concentrations were also observed in the three other wells (MW-1, MW-3, and MW-4). Concentrations of chloroethane, 1,1-DCA, 1,1-DCE, 1,1,1-TCA, vinyl chloride, isopropylbenzene, and n-propylbenzene were reported in at least one sample collected from these wells since monitoring began in March 1993. However, during the last sampling event, none of the compounds were detected above laboratory reporting limits.

For the remaining wells (MW-5 through MW-9) that were sampled for the first time in August 2006, a reduction in concentrations of TPHg, BTEX, VOCs, and TPHd was observed during the last sampling event (October 2007). Concentrations of BTEX in samples collected from wells MW-5 through MW-8 were below detectable limits during the last sampling event. Benzene concentrations in well MW-9 declined from a high of 250 ug/L in August 2006 to 89 ug/L in October 2007. In addition, concentrations of TPHg declined from a high of 7,400 ug/L in well MW-9 during the August 2006 sampling event to 1,300 ug/L for the October 2007 sampling event.

Of the constituents detected in groundwater collected during the October 2007 sampling event, only 1,1-DCA, 1,1-DCE, and vinyl chloride were detected at concentrations above historic concentrations. All elevated concentrations were detected in groundwater samples collected from wells located in the Parking Lot Area. The elevated concentrations of 1,1-DCA, 1,1-DCE, and vinyl chloride in groundwater underlying the Parking Lot Area are most likely the daughter products associated with the reductive dechlorinationation of 1,1,1-TCA.

5.3.5.2 Geochemical Data

Secondary lines of evidence indicating the occurrence of ongoing plume reduction through natural means involves the testing of a select group of geochemical indicators. These geochemical indicators provide evidence of microbial biodegradation of hydrocarbons. Geochemical indicator parameters include general environmental parameters, electron acceptor/donor constituents, and by-products of these constituents that may be generated in the subsurface as a consequence of microbiological activity. The following geochemical parameters were measured in the groundwater samples:

- Alkalinity;
- Dissolved Manganese;
- Dissolved Oxygen;
- Nitrate;
- Sulfate;
- Ferrous Iron;

- Chloride;
- Groundwater Temperature;
- PH;
- Oxidation-reduction potential (ORP);
- Dissolved Oxygen (DO), and
- Methane, ethane, and ethane.

Field-measured geochemical parameters (DO, ORP, pH, and temperature) collected on October 24 and October 25, 2007 are included on the field sampling logs (Appendix D) and laboratory geochemical parameters are summarized in Table 7.

Geochemical indicator parameters were collected from wells MW-1, MW-2R, and wells MW-3 through MW-9. Well MW-4 did not have detections of any compounds above laboratory reporting limits. Therefore, geochemical data obtained from the samples collected from well MW-4 was used as the background or "control" sample for this evaluation.

1) Alkalinity

An elevated level of alkalinity within a contaminant plume can serve as an indicator of increased microbial activity. Total alkalinity levels ranged from 330,000 to 960,000 milligrams per liter (mg/L). Elevated concentrations of total alkalinity may indicate the presence of microbial activity. Compared to the value of 350,000 mg/L reported in the control sample, samples collected during the October 2007 sampling generally show elevated alkalinity levels, suggesting the presence of microbial activity.

2) Dissolved Manganese

Dissolved manganese is a potential by-product resulting from the dissolution or desorbtion of manganese from the aquifer matrix material under anaerobic biological conditions. Elevated dissolved manganese concentrations within a contaminant plume can serve as an indirect indicator of increased microbial activity. Dissolved manganese levels in groundwater ranged from 340 to 3,900 mg/L. Compared to the reported value of 1,700 mg/L in the control sample, samples from four of the wells showed elevated levels of dissolved manganese, suggesting the presence of microbial activity.

3) Dissolved Oxygen

Dissolved oxygen (DO) is an important parameter for evaluation of natural attenuation. DO is the most thermodynamically favored parameter affected by microbial activity in groundwater. Therefore, DO is typically the first electron acceptor for anaerobic biodegradation. At DO concentrations below 0.5 mg/L, anaerobic conditions that support reductive dechlorination will predominate, and aerobic metabolic

pathways will subside. At DO concentrations above 1.0 mg/L, microbial reductive dechlorination via anaerobic biodegradation is unlikely to occur, although other metabolic pathways may transform chlorinated hydrocarbon contamination. Five of the wells (MW-2R, MW-5, MW-7, MW-8, and MW-9) had DO concentrations below 1.0 mg/L. The remaining three wells (not including the control sample) had DO concentrations above 1.0 mg/L. However, all three wells in which DO concentrations were above 1 mg/L were located in areas unimpacted with CVOCs. The DO levels observed in the areas of the five wells suggest that anaerobic biodegradation is occurring.

4) Nitrate

Once dissolved oxygen is depleted in groundwater, nitrate is typically the next compound to be an electron acceptor for anaerobic biodegradation of organic compounds. However, for reductive dechlorination to occur using nitrate as the electron acceptor, the nitrate concentrations in groundwater must be less than 1 mg/L. All groundwater samples reported had concentrations of nitrate below the laboratory reporting limits. This suggests that microbial reductive dechlorination of CVOCs may be supported by the current nitrate conditions.

5) Sulfate

After dissolved oxygen and nitrate are depleted in groundwater, sulfate is typically the next compound to be used as an electron acceptor by microbes to continue anaerobic biodegradation of organic compounds. This process is termed sulfate reduction. In general, concentrations of sulfate of 20 mg/L or less are considered favorable for reductive dechlorination using sulfate as the electron acceptor, although there is some evidence that reductive dechlorination will occur at higher sulfate concentrations. Concentrations of sulfate in groundwater samples were below laboratory detectable limits. These levels suggest that microbial reductive dechlorination of CVOCs may be supported by current sulfate conditions.

6) Ferrous Iron (Fe+2)

In some cases, ferric iron (Fe^{+3}) is used as an electron acceptor during biological transformation of organic compounds. During this process, ferric iron (Fe^{+3}) is reduced to ferrous iron (Fe^{+2}), which is more soluble in water. The presence of ferrous iron at concentrations of greater than 1 mg/L can serve as an indicator that anaerobic microbial respiration is occurring. All samples reported ferrous iron concentrations in excess of 1 mg/L. These levels suggest that microbial reductive dechlorination of CVOCs may be supported by current ferrous iron conditions.

7) Chloride

Chloride is released to groundwater as biodegradation of dissolved CVOCs progresses. Elevated chloride concentrations within the dissolved contaminant plume can serve as an indicator of the

degradation of chlorinated contaminants. Chloride concentrations ranged from 69,000 to 250,000 mg/L in samples collected. Compared to the reported value of 21,000 mg/L in the control sample, groundwater collected fro the wells show elevated levels of chloride, suggesting the occurrence of natural attenuation via reductive dechlorination

8) Groundwater Temperature

Groundwater temperature affects the solubility of dissolved gases and the rate of microbial metabolic activity. At temperatures greater than 20^{o}C, biochemical processes are generally accelerated. Groundwater temperatures in groundwater monitoring wells ranged from 18.59^{o}C to 25.21^{o}C. These temperatures are within the range considered conducive to microbial degradation of hydrocarbons.

9) pH

The negative logarithm of the hydrogen ion concentration is defined as pH and indicates when a solution is acidic, neutral, or basic. Groundwater pH can both effect, and be affected by, microbial activity in the subsurface. Groundwater pH values between 6 to 8 are accepted as optimal for microbial activity. Groundwater pH in wells ranged from 6.25 to 7.75. Based on these measurements, the pH of the groundwater would not be expected to have an adverse effect on microbial activity at the Site.

10) Oxidation-reduction potential (ORP)

ORP is a measure of the electron activity and provides an indication of the relative tendency of solute species to either accept or lose electrons in the groundwater environment. Low or negative ORP measurements are indicative of an anaerobic environment, while high or positive ORP measurements are indicative of an aerobic environment. Under either aerobic or anaerobic conditions, the ORP of groundwater within the contaminant plume should be less than that measured outside the plume. An ORP measurement of less than 50 millivolts (mV) would indicate that reductive dechlorination of CVOCs is possible. All groundwater monitoring wells had measured ORP readings less than 50 mV, except for well MW-6.

11) Methane, Ethane, and Ethene

Methane production occurs following the depletion of oxygen, nitrate, and sulfate in the groundwater plume. Methanogenesis occurs when naturally occurring methanotrophic microorganisms begin to use simple organic compounds or dissolved hydrogen. Ethane and ethene are produced from reductive dechlorination of chloroethane and vinyl chloride. These compounds are generally found at low concentrations and do not occur unless microbes in groundwater are under highly reduced conditions. Generally, methane concentrations of <1 mg/L, and ethane and ethene concentrations of <0.1 mg/L favor the reductive dechlorination of vinyl chloride. Eight of the nine samples collected reported methane concentrations in excess of 1 mg/L, which could promote the accumulation of vinyl chloride. However,

vinyl chloride was only detected in one well, MW-3, at a concentration of 7.5 ug/L. The high concentration of methane in groundwater samples collected from the well along with the presence of vinyl chloride suggests that addition carbon substrates may be necessary to completely reduce vinyl chloride to ethene.

Conclusions

Review of the current and historical chemical monitoring data indicates that VOC concentrations have remained steady and/or decreased in the source areas and downgradient wells. This data is consistent with previous conclusions that 1,1,1-TCA source contaminants are degrading in the Site subsurface producing later stage degradation products (i.e., 1,1- DCA, chloroethane, and vinyl chloride) and resulting in lower concentrations (See Appendix A for a complete summary of chemical data).

Overall, data collected and evaluated indicate conditions are favorable for the reductive dechlorination process to have an effect on the Site plume. Primary indicators, such as elevated chloride concentrations and an overall decrease in VOC concentrations, suggest that the process has already had a significant effect, and that VOC reduction by natural attenuation will continue into the future.

5.4 Quality Assurance/Quality Control

The analytical laboratory data was reviewed by SGI to establish its validity and to ensure the laboratory data was complete and accurate. SGI verified that holding times for each analytical method were achieved and that the laboratory achieved the specific data quality objectives for each selected analytical method. A review of the data validation process indicates that the laboratories completed all QA/QC activities required for the samples such as blanks, lab control samples, matrix spikes, and duplicates. Minor QA/QC issues, which are common for these analyses, are noted in the laboratory reports presented in Appendix E. The QA/QC parameters for the samples were within acceptable limits and suggest that the data is useful for its intended purpose.

6.0 CONCEPTUAL SITE MODEL

In order to meet the requirements for a "risk-based" closure, a conceptual understanding of the Site was developed to identify potential exposure pathways and human receptors. In order to develop a conceptual understanding for the Site, information regarding potential chemical sources, chemical release and transport mechanisms, locations of potentially exposed human receptors, and potential exposure routes are assessed. The conceptual Site model (CSM) associates sources of chemicals with potentially exposed human receptors and associated complete exposure pathways.

As defined by USEPA (1989), all of the following four components are necessary for a chemical exposure pathway to be considered complete and for chemical exposure to occur:

- A chemical source and a mechanism of chemical release to the environment;
- An environmental transport medium (e.g., soil) for the released chemical;
- A point of contact between the contaminated medium and the receptor (i.e., the exposure point); and
- An exposure route (e.g., dermal contact with chemically-impacted soils and groundwater) at the exposure point.

The following sections describe these components and provide a basis for the CSM.

6.1.1 Initial Characterization of Potential Source Areas

The first component necessary for an exposure pathway to be complete, chemical sources at the Site are discussed in this section. An iron foundry has operated on the Site for approximately 77 years. Business activities include the manufacture of cast pipe and fittings. The facility accepts scrap iron and steel, which it stockpiles on-site, and uses during manufacturing activities. The Site encompasses an area of approximately 11.8 acres. Previously, seven USTs have been located on-site. These USTs included two 8,000-gallon USTs used for storing unleaded gasoline and 1,1,1-TCA, a 550-gallon UST used for storing regular leaded gasoline, a 10,000-gallon UST used for storing diesel, and three 10,000 gallon-USTs used for storing gasoline.

Investigations have identified TPH, PAHs, and VOC-affected soil and TPH and VOC-affected groundwater (chemicals of interest (COI)). Therefore, the CSM focuses on TPH, PAHs, and VOCs and their potential to migrate into soil, groundwater, and surface water. Potential contact to COIs from the Site could occur via exposure to soil, soil gas, groundwater, and/or indoor air.

6.1.2 Chemical Release Mechanisms and Identification of Transport Media

In this section, the first two components necessary for a complete exposure pathway are addressed. Chemical properties of the COIs and the physical characteristics of the Site were reviewed to identify factors that might allow the release and transport of a chemical from the soil, soil gas, or groundwater.

Release of chemicals can potentially occur through volatilization, wind and/or mechanical erosion (i.e., during construction), migration of chemicals into the groundwater, or lateral migration of chemicals in soil gas and groundwater. These types of releases may result in chemical vapor or dust (with sorbed chemicals) emissions in air, or the movement of chemicals downward into groundwater with infiltrating rain water (i.e., leaching from soil). These potential release mechanisms are discussed in more detail below.

Volatilization of Chemical Vapors

As previously indicated, many of the COIs are VOCs. These chemicals typically have a low organic-carbon partition coefficient (K_{oc}), a low molecular weight, and a high Henry's Law constant, indicating that these chemicals may volatilize. Therefore, volatilization of VOCs was evaluated in this assessment.

Emission of Fugitive Dust

Some of the COIs (i.e., metals in soil) adsorb readily to dust particles. Chemicals adsorbed to soil particles can be blown into the air. This is referred to as fugitive dust. Exposure to metals in soil via fugitive dust emissions was evaluated in this assessment.

Leaching and Lateral Transport of Chemicals in the Vadose Zone

The evaluation of chemical concentrations in soil for groundwater protection (soil leaching) is designed to address the potential leaching of chemicals from vadose zone soils and their subsequent impact on groundwater (CRWQCB, 2007). In general, the application for modeling the downward migration of leachate in the vadose zone assumes a layer of clean soil overlying clean groundwater. Chemicals detected in the vadose zone at the Site are limited to onsite areas, and as outlined in section 5.3.2, the majority of source areas were removed during excavation activities associated with the removal of the former USTs In addition, the highest concentrations of TPH and VOCs in soil are located within the saturated zone (Figures 4, 5, 12, and 13). Therefore, the saturated zone and groundwater beneath the Site are already impacted.

Based on the following reasons the leaching of contaminants in the vadose zone into groundwater was not considered a significant exposure pathway and was not evaluated in this assessment:

- Limited VOC contamination mass in the vadose zone of the onsite areas;

- Limited VOC concentrations detected in soil gas within the vadose zone; and
- Greater lateral extent of VOC concentrations in the saturated zone.

6.1.3 Potentially Exposed Receptors

The third component necessary for an exposure pathway to be complete, human receptors, is presented in this section. Hypothetical human receptors identified for evaluation in this assessment were identified on the basis of proximity to the Site, proposed activities that could possibly result in direct or indirect contact with Site-related contaminants, current and future Site use (i.e., the Site is zoned commercial/industrial and is expected to remain commercial/industrial). None of the Site or adjoining properties have current resident receptors or zoning consistent with residential development, nor is any residential development anticipated. The Site has operated as a foundry for the last 77 years. The Site and surrounding areas are currently zoned for commercial/industrial use and they are expected to remain as such in the future. Therefore, the following human receptors were evaluated in this assessment:

- Hypothetical Onsite Outdoor Commercial/Industrial Worker Receptor (current exposure scenario);
- Hypothetical Onsite Indoor Commercial/Industrial Worker Receptor (current exposure scenario); and
- Hypothetical Onsite Outdoor Construction Worker Receptor (future exposure scenario)

6.1.4 Exposure Pathways Considered Potentially Complete and Significant

In this section, a complete exposure pathway (i.e., route of exposure) is discussed in combination with the other components (i.e., presence of receptors) to define those exposure pathways considered to be complete and significant. As indicated in section 6.1.2, potential contact to COIs from the Site could occur via exposure to soil, soil gas, groundwater, and/or indoor air. Because no active domestic water supply wells pumping from the shallow aquifer zone for beneficial use within a 1-mile radius of the Site have been identified, exposure pathways associated with the domestic use of groundwater were not considered complete and therefore were not included in this assessment.

Current exposure routes identified include the inhalation of indoor and outdoor vapors originating from subsurface soil and groundwater. The current exposure scenario does not include groundwater or soil ingestion or dermal contact since the entire Site is covered with asphalt, concrete, and buildings and therefore soil and groundwater contaminants underlying the Site are not accessible. There is no evidence that vertical migration has occurred to depths which could affect deeper aquifers, which may or may not be more suitable for potable and nonpotable purposes. Future exposure scenarios include, in addition to the inhalation of outdoor vapors originating from subsurface soil and groundwater, dermal contact and ingestion of affected soil. The following sections briefly describe each of the hypothetical

receptors and summarize those pathways considered complete and potentially significant for each receptor.

6.1.4.1 Hypothetical Outdoor Commercial/Industrial Worker Receptor (current exposure)

The hypothetical outdoor commercial/industrial worker receptor is a long-term receptor (i.e., 7 years to a lifetime [USEPA, 1989]). This receptor is a full-time employee that is assumed to spend 250 days per year at work (i.e., 5 days per week, 50 weeks per year [2 weeks per year are assumed to be spent away from the Site]). The exposure duration for this receptor is 25 years. This receptor spends the workday conducting outdoor maintenance activities. As defined by the USEPA, the work-related activities may include moderate soil invasive activities (i.e., digging and landscaping) in surface or near surface soils (0 to 3 ft-bgs). Because this receptor is not expected to be working in buildings, inhaling chemical vapors while indoors was not considered a complete and significant exposure pathway. The hypothetical indoor commercial/industrial worker receptor was included to evaluate the indoor air exposure pathway.

Potential exposures for this receptor are expected to occur from working outdoors only. As stated above, because the Site is currently covered by asphalt, concrete, and buildings, and is expected to remain as such in the future, ingestion and dermal contact of soil and groundwater was not considered a significant and complete exposure pathway for this receptor.

The exposure pathways assumed to be complete and significant for the hypothetical outdoor commercial/industrial worker receptor include:

- Inhalation of vapors in outdoor air volatilizing from the subsurface.

6.1.4.2 Hypothetical Indoor Commercial/Industrial Worker Receptor (current exposure)

The hypothetical indoor commercial/industrial worker receptor is a long-term receptor (i.e., 7 years to a lifetime [USEPA, 1989]). Similar to the outdoor commercial/industrial worker, this receptor is assumed to represent a full-time employee that spends 250 days per year at work (i.e., 5 days per week, 50 weeks per year [2 weeks per year are assumed to be spent away from the Site]). The exposure duration for this receptor is 25 years. This receptor spends the workday indoors performing light office duties and has limited to no direct contact with outdoor soils. Although inhalation of outdoor air may be complete, outdoor air concentrations are typically lower than indoor air concentrations due to dispersion; such relatively minor exposures are subsumed by the assumption that all exposure is from indoor air.

The exposure pathways assumed to be complete and significant for the hypothetical indoor commercial/industrial worker receptor include:

- Inhalation of vapors in indoor air volatilizing from the subsurface.

6.1.4.3 Hypothetical Outdoor Construction Worker Receptor (future exposure)

The hypothetical outdoor construction worker receptor, similar to the outdoor commercial/industrial worker, is also assumed to be a long-term receptor (i.e., 7 years to a lifetime [USEPA, 1989]). This receptor is a full-time employee that is assumed to spend 250 days per year at work (i.e., 5 days per week, 50 weeks per year [2 weeks per year are assumed to be spent away from the Site]). The exposure duration for this receptor is 25 years. This receptor spends the workday conducting outdoor maintenance activities. The work-related activities may include moderate soil invasive activities (i.e., digging and landscaping) in surface or near surface soils (0 to 3 ft-bgs). Because this receptor is not expected to be working in buildings, inhaling chemical vapors while indoors was not considered a complete and significant exposure pathway.

Potential exposures for this receptor are expected to occur from working outdoors only. Depth to groundwater at the Site ranges from 4 to 9 feet bgs. It is assumed that during any construction activities, appropriate soil and groundwater management and personal protective equipment (PPE) will be utilized to prevent exposure to impacted soil and groundwater. Dermal contact and ingestion of groundwater would be expected to be incidental and therefore is not considered a complete and significant exposure pathway for this receptor. It was also assumed that upon completion of any construction activities, any paved areas that were removed would be repaved.

The exposure pathways assumed to be complete and significant for the hypothetical outdoor construction worker receptor include:

- Ingestion of soil;
- Dermal contact with soil; and
- Inhalation of dusts/vapors in outdoor air generated from soil and groundwater.

7.0 TIER 1 SCREENING-LEVEL RISK EVALUATION

A screening level risk assessment (SLRE) can be conducted to provide a basis for evaluating whether action is warranted to mitigate potential health effects from exposure to contaminants in soil or soil gas at any of the five areas. Based on the exposure pathways and receptors identified in the CSM, appropriate ESLs were selected for this SLRE.

The assessment focuses solely on those chemicals that are expected to account for the majority of the estimated health impacts at the Site. In the USEPA (1989) paradigm, these are known as COPCs. Under the Tier 1 SLRE, a chemical was identified as a COPC if the following conditions applied:

- A maximum detected concentration exceeding relevant background (ambient) concentration for metals only. Both USEPA (1989) and CalEPA (1992) recommend that metals detected at background (ambient) levels should be eliminated as potential COPCs at a site; and
- A maximum detected concentration exceeded applicable risk-based CRWQCB ESLs.

These conditions are discussed in more detail in the following sections.

7.1 Background/Ambient Concentrations

CalEPA (1992) recommends that metals detected at background (ambient) levels not be identified as COPCs at a site. Background metal concentrations were obtained from data presented in the Soil Management Plan prepared as part of the Lawrence Berkeley National Laboratory (LBNL) Environmental Restoration Program (LBNL, 2006). A complete list of analytical results for metal concentration in soil samples along with the LBNL background levels can be found in Table 5.

Based on the comparison with background, the following metals were identified as present at background/ambient levels:

- Antimony;
- Arsenic;
- Barium;
- Cadmium
- Cobalt
- Molybdenum;

- Nickel; and
- Silver

7.1.1 Risk-Based Environmental Screening Levels

For this SLRE, ESLs developed by the CRWQCB were used exclusively (CRWQCB, 2007). The ESLs were developed for soil gas, soil, and groundwater for chemicals commonly found at sites impacted by releases of hazardous substances. The ESLs are presented in the document titled, "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater," Interim Final - November 2007 (CRWQCB, 2007).

The CRWQCB-SF ESLs include a broad scope of screening levels, some of which are not strictly risk-based. The risk-based ESLs correspond to an excess cancer risk of 1×10^{-6} or a hazard quotient of 0.2, based on standardized equations (CRWQCB, 2007) that combine exposure assumptions with agency-derived toxicity data. The risk-based ESLs are developed for direct contact with soil exposure scenarios (i.e., ingestion, dermal contact, and inhalation of dust/vapor in outdoor air) and indoor air exposure scenarios.

The ESLs were developed to address environmental protection goals presented in the Water Quality Control Plan for the San Francisco Bay Basin (RWQCB 2006). These goals include:

Surface Water and Groundwater:

- Protection of drinking water resources;
- Protection of aquatic habitats;
- Protection against vapor intrusion into buildings;
- Protection against adverse nuisance conditions.

Soil:

- Protection of human health (direct-exposure);
- Protection against vapor intrusion into buildings;
- Protection against leaching and subsequent impacts to groundwater;
- Protection of terrestrial biota;
- Protection against adverse nuisance conditions.

The RWQCB's ESL document includes an approach that presents target screening levels for use in assessing whether a more detailed site-specific risk assessment and/or site remediation is warranted. ESL concentrations are based on exposure pathways (e.g., ingestion, dermal contact with soil and inhalation) for specific land-use conditions, including impacts to groundwater and ecological receptors.

The soil ESLs for groundwater protection (soil leaching) were developed to address potential leaching of chemicals from vadose zone soils and subsequent impact on groundwater. Soil impacts are limited to the onsite areas. Therefore, any leaching potential from the vadose zone into groundwater is limited to the onsite areas. However, the greater lateral extent and highest concentrations of the VOCs in soil lie within the saturated zone (Figures 4, 5, 12, and 13). Therefore, the saturated zone and groundwater beneath the Site are already impacted. Due to minimal VOC mass in the vadose zone and greater VOC mass in the saturated zone, ESLs for the protection against leaching into groundwater were not relevant to this SLRE.

The urban area ecotoxicity criteria provided in the ESL document were intended for the protection of terrestrial biota under various land use scenarios, including residential, agricultural, and parkland. The Site is zoned commercial/industrial and includes industrial facilities, office buildings, streets, and parking lots (Section 2.1). It is very unlikely that these areas support any relevant terrestrial habitat. Therefore, the urban area ecotoxicity criteria are not applicable to this SLRE.

As indicated previously in Section 2.2, there are no known active domestic water supply wells pumping from shallow aquifers for beneficial use within a 1-mile radius of the Site. For the reasons outlined in Section 2.2, ESLs for the protection of drinking water resources were not applicable to this SLRE.

The nearest surface water body is Elmhurst Creek, which bounds the southern edge of the Site. Elmhurst Creek is channeled through urban areas and drains stormwater toward San Leandro Bay (approximately 1 mile from the Site). The nearest wildlife refuge (Don Edwards) is approximately 30 miles southeast of the Site. There is no evidence of interaction between contaminants in groundwater and regional surface water features, due to the distance from the Site to the point of potential interception. Therefore, aquatic habitat goals are not applicable to this SLRE.

For this SLRE, the risk-based CRWQCB ESLs (CRWQCB, 2007) were used exclusively. These ESLs represent conservative screening values below which adverse effects on human health are not expected to occur. The ESLs are currently available for the indoor commercial/industrial worker receptor potentially exposed to chemicals via inhalation of vapor in indoor air exposure pathways, and for the outdoor commercial/industrial and outdoor construction worker receptor potentially exposed to chemicals via direct contact exposure pathways. The soil gas, soil, and groundwater screening levels used in this SLRE are summarized in Tables 2 through 5 and Table 6, respectively.

7.2 Results of the Screening-Level Risk Evaluation

This section summarizes the SLRE results for the Site. COPCs were identified in each media and for each area on the Site. The results are discussed by media/receptor below.

7.2.1 Chemicals of Potential Concern in Soil

This section summarizes the COPCs identified for each of the potential human receptors evaluated. Soil COPCs were identified by a sample-by-sample comparison between detected concentrations in soil and CRWQCB ESLs.

7.2.1.1 Hypothetical Outdoor Commercial/Industrial Worker Receptor

This section describes the COPCs in soil for the hypothetical outdoor commercial/industrial worker exposure scenario by area on the Site. The complete exposure pathways for this receptor include the inhalation of vapors in outdoor air volatilizing from the subsurface.

Outdoor air concentrations are typically lower than indoor air concentrations due to dispersion; such relatively minor exposures are subsumed by the assumption that all exposure is from indoor air. In addition, all outdoor areas are paved with asphalt and concrete. Therefore, inhalation of vapors in outdoor air from the volatilizing of contaminated soil is not expected to be a significant and complete exposure scenario.

7.2.1.2 Hypothetical Indoor Commercial/Industrial Worker Receptor

The only complete and significant exposure pathway for the indoor commercial/industrial worker is inhalation of vapors in indoor air volatilizing from the subsurface. This exposure pathway will be evaluated using soil gas data, which assumes potential contaminants volatilizing from the subsurface soil and groundwater will be detected in soil gas. The California Environmental Protection Agency Department of Toxic Substance Control (DTSC) discourages use of soil data when evaluating the vapor intrusion pathway, and instead recommends use of soil gas data for assessment of the indoor air pathway (CalEPA, 2005). Of the seven soil gas samples that reported concentrations of either PCE, chloroethane, or BTEX constituents, none had concentrations in excess of their respective residential or commercial-use scenario ESLs. Therefore, vapor intrusion into indoor air is not considered a significant exposure scenario.

7.2.1.3 Hypothetical Outdoor Construction Worker Receptor

This section describes the COPCs in soil for the hypothetical outdoor construction worker exposure scenario by area on the Site. The complete exposure pathways for this receptor include direct contact

with soil (e.g., ingestion, dermal contact, and inhalation of dust/vapor in outdoor air pathways. Soil data was compared with ESLs for the construction worker exposure scenario.

Three Former 10,000-gallon USTs Area

The following COPCs in soil were identified for the hypothetical outdoor construction worker receptor:

- TPHd

Of the 25 soil samples collected in the area of the three former 10,000-gallon USTs, 12 percent of the samples had concentrations that exceeded ESLs for TPHd.

Former 550-gallon Gasoline UST Area

The following COPCs in soil were identified for the hypothetical outdoor construction worker receptor:

- Thallium
- Vanadium

Parking Lot Area

No soil samples were collected in the area of the parking lot.

Former 8,000-gallon 1,1,1-TCA UST Area

The following COPCs in soil were identified for the hypothetical outdoor construction worker receptor:

- Naphthalene
- Benzo[a]anthracene
- Benzo[b]fluoranthene
- Benzo[k]fluoranthene
- Benzo[a]pyrene
- Indeno[1,2,3-cd]pyrene
- Dibenz(a,h)anthracene
- TPHd
- Copper

Of the three soil samples analyzed for PAH compounds in the area of the former 8,000-gallon 1,1,1-TCA UST, one sample had concentrations of at least one PAH compound above its respective ESL. Of the fifteen samples analyzed for TPHd, 20 percent had concentrations of TPHd above its ESL. In addition, 16 percent of the six soil samples analyzed for metals had concentrations of copper above its ESL.

Former 10,000-gallon Diesel UST Area

The following COPCs in soil were identified for the hypothetical outdoor construction worker receptor:

- Lead

7.2.2 Chemicals of Potential Concern in Soil Gas

This section summarizes the COPCs identified for each of the potential human receptors. The soil gas data was collected in all UST areas with the exception of the 10,000 gallon diesel UST area. Therefore, in order to conservatively identify COPCs in soil gas for all areas of the Site, all of the soil gas data was combined into a single data set for use in the SLRE. If a duplicate soil gas sample was available, the maximum concentration detected in either the sample or duplicate sample was included in the soil gas data set for this assessment. Soil gas COPCs were identified by a comparison between maximum detected concentrations in soil gas and appropriate soil gas ESLs for indoor air impacts. This comparison is presented in Table 2.

7.2.2.1 Hypothetical Outdoor Commercial/Industrial Worker Receptor

The inhalation of soil gas vapors in indoor air is not a complete exposure pathway for an outdoor worker; therefore, soil gas is not a media of concern for this receptor.

7.2.2.2 Hypothetical Indoor Commercial/Industrial Worker Receptor

This section describes the COIs in soil gas for the hypothetical indoor commercial/industrial worker exposure scenario within the Site. The only complete and significant exposure pathway for chemicals in soil gas is inhalation of vapors in indoor air. None of the COIs in soil gas were identified for the hypothetical indoor commercial/industrial worker receptor above their respective ESL under either the residential or commercial exposure scenario. Therefore, the current, maximum concentrations of VOCs in soil gas do not exceed the ESL values and do not represent a risk to the hypothetical indoor commercial/industrial worker. Soil gas ESLs are summarized in Table 2.

7.2.2.3 Hypothetical Outdoor Construction Worker Receptor

The inhalation of soil gas vapors in indoor air is not a complete exposure pathway for an outdoor worker; therefore, soil gas is not a media of concern for this receptor.

7.2.3 Chemicals of Potential Concern in Groundwater

This section summarizes the COPCs identified for each of the potential human receptors. During the October/November 2007 investigation, monitoring well and grab groundwater samples were collected. However, due to the presence of suspended sediments in grab groundwater samples, concentrations of contaminants in these samples are biased high. Therefore, only groundwater data from samples collected from monitoring wells are used in this SLRE. Groundwater COPCs were identified by a comparison between maximum detected concentrations in groundwater and appropriate groundwater ESLs.

As mentioned in section 6.1.4, ingestion and dermal contact of groundwater is not considered to be a significant and complete exposure pathway for any of the receptors. However, inhalation of vapors in indoor air generated from contaminant-affected groundwater is considered a significant and complete exposure pathway. Therefore, groundwater ESLs for vapor intrusion to indoor air were used for this SLRE. This comparison is presented in Table 6.

7.2.3.1 Hypothetical Outdoor Commercial/Industrial Worker Receptor

The inhalation of soil gas vapors from groundwater in indoor air is not a complete exposure pathway for an outdoor worker; therefore, soil gas is not a media of concern for this receptor.

7.2.3.2 Hypothetical Indoor Commercial/Industrial Worker Receptor

The only complete and significant exposure pathway for the indoor commercial/industrial worker is inhalation of vapors in indoor air volatilizing from the subsurface. No COPCs were identified for the hypothetical indoor commercial/industrial worker receptor in any of the former UST areas with the exception of the Parking Lot Area.

For the Parking Lot Area the following COPCs in groundwater were identified for the hypothetical indoor commercial/industrial worker receptor:

- 1,1-DCA
- vinyl chloride

Of the four groundwater monitoring well samples collected in the Parking Lot Area, 1,1 DCA and vinyl chloride exceeded their respective ESLs in monitoring wells MW-3 and MW-8, respectively (Figure 13). Monitoring wells MW-3 and MW-8 are located in the parking lot area away from any buildings. Further as discussed in section 7.2.2.2, none of the COIs in soil gas were identified for the hypothetical indoor commercial/industrial worker receptor above their respective ESL under either the residential or commercial exposure scenario. Therefore, vapor intrusion into indoor air is not expected to constitute a significant threat to the hypothetical indoor commercial/industrial worker receptor.

7.2.3.3 Hypothetical Outdoor Construction Worker Receptor

This section describes the COPCs in groundwater for the hypothetical outdoor construction worker exposure scenario by area on the Site. The complete exposure pathways for this receptor include inhalation of vapors in outdoor air volatilizing from the subsurface.

Outdoor air concentrations are typically lower than indoor air concentrations due to dispersion; such relatively minor exposures are subsumed by the assumption that all exposure is from indoor air. Therefore, inhalation of vapors in outdoor air from the volatilizing of contaminated groundwater is not a significant exposure scenario.

7.2.4 Summary of SLRE Results

Human exposures for the SLRE were evaluated assuming that the most likely receptors at the Site, under current and future scenarios, are workers. Exposure routes within these scenarios include the inhalation of vapors from underlying contaminated soil and groundwater (i.e., the current outdoor and indoor commercial/industrial workers operating at the Site) and ingestion, inhalation and dermal contact through direct contact with contaminated media (i.e., the future construction worker scenario). Both the current and future scenarios use the maximum values (i.e., concentrations of TPH and VOCs) for the Site and assume that observed concentrations will not decrease over time, a conservative bias. Groundwater ingestion is not considered in this assessment because contaminated groundwater underlying the Site is not considered suitable for use in the future due to expected limited yield, poor water quality parameters excluding petroleum hydrocarbons and VOCs, and the use of the surrounding area. In addition, there is no evidence that vertical migration has occurred to depths which could affect deeper aquifers, which may be more suitable for potable and non-potable purposes.

Soil gas samples were collected from 10 locations at the Site. Of the ten samples collected, three of the samples did not report concentrations of any VOCs above the laboratory's reporting limits. Of the seven remaining samples, concentrations of chloroethane, BTEX, and PCE were detected. However, none of the VOCs were detected at concentrations in excess of their respective ESLs under either the residential or commercial land-use exposure scenario.

None of the concentrations of TPHg, TPHd, BTEX, and PAHs exceed ESLs for shallow soil under the commercial land use scenario with the exception of the Former Three 10,000-Gallon UST Area and the Mineral Spirits/1,1,1- TCA UST Area. TPHd exceeded its ESL in both of these areas and a number of PAHs exceeded their restive ESLs in one soil (tar material) sample collected from the area of the Mineral Spirits/1,1,1-TCA UST Area.

One or more CAM 17 metals were reported in all soil samples analyzed for this investigation. Concentrations were compared with regional background metal concentrations to differentiate between metal concentrations present in samples due to ambient conditions and those present as a result of site–related activities. Of the metals detected, only beryllium, chromium, copper, lead, mercury, selenium, thallium, vanadium, and zinc were reported at concentrations in excess of their respective background levels. Of these nine metals, only copper, lead, thallium, and vanadium exceeded their respective ESLs (commercial land-use scenario) in three locations.

For groundwater no current TPHg, TPHd, and BTEX concentration exceeds its respective ESL where, as here, groundwater is not considered a current or potential drinking water source. If groundwater were a current or potential drinking water source, the concentration of TPHg, TPHd, and benzene would exceed the RWQCB ESLs.

No CVOCs were detected in soil samples collected as part of this investigation with the exception chloroethane. CVOC-affected groundwater appears to be limited to the area downgradient of the former 8,000 gallon Mineral Spirits/1,1,1- TCA UST and does not extend offsite. The highest concentrations of CVOCs are located in the parking lot area. Review of groundwater monitoring well sampling results indicates that no current CVOC concentration exceeds its respective ESL with the exception of 1,1-DCA and vinyl chloride (located in the Parking Lot Area) where, as here, groundwater is not considered a current or potential drinking water source. If groundwater were a current or potential drinking water source, the concentration of 1,1-DCA, 1,1-DCE, chloroethane, 1,1,1-TCA, and vinyl chloride would exceed the RWQCB ESLs.

ESLs for non-drinking water are based on the protection of vapor intrusion to indoor air. As indicated above, the location of the elevated 1,1-DCA and vinyl chloride concentrations that exceeds ESLs are located in the parking lot area (outdoors) away from any buildings. Further none of the CVOCs in soil gas were identified for the hypothetical indoor commercial/industrial worker receptor above their respective ESL under either the residential or commercial exposure scenario. Therefore, vapor intrusion from groundwater into indoor air is not expected to constitute a significant threat to the hypothetical indoor commercial/industrial worker receptor.

8.0 REGULATORY CRITERIA FOR SOIL AND GROUNDWATER CLEANUP

Regulatory criteria for soil and groundwater cleanup of petroleum and chlorinated VOC release sites have been subject to rethinking by regulators and the regulated community. In the past, maximum contaminant levels (MCLs) for drinking water have been used as the criteria for groundwater remediation of CVOCs and petroleum hydrocarbon compounds. MCLs were used even though at many sites the impacted water bearing zone is not a drinking water source or a likely source due to inadequate yields and other water quality issues (e.g. bacteria, total dissolved solids). Soil cleanup levels are often more site specific but generally are set at levels where concentrations in soil will not cause groundwater quality to exceed MCLs. More recently, the RWQCB's and local implementing agencies have moved toward a risk-based corrective action approach to selecting soil and groundwater cleanup level goals. The risk-based approach recognizes that shallow groundwater will likely never provide a viable drinking water supply and the success and cost of active remedial actions does not always warrant the expense given that the CVOCs and petroleum hydrocarbons are likely to undergo natural degradation with time. Furthermore although active remedial actions may serve to show reduced concentrations of the contaminants with time at the monitored locations, petroleum hydrocarbons and CVOCs remain in the subsurface.

The State Water Resources Control Board's underground tank section has issued a draft resolution that would establish a statewide policy for the elimination of "low-risk" petroleum underground storage tank (UST) sites from further regulatory actions from Regional Boards and local agencies. The use of "risk-based correction action" has been used to assist the RWQCB in determining which sites should be targeted for more aggressive cleanup and, correspondingly, which sites can be left with contamination in-place to degrade naturally.

Using a risk-based approach to corrective action and establishing cleanup level goals, no further action would be required at the Site. The results of the SLRE presented in Section 7 indicates that the maximum concentrations of COPCs at the Site did not exceed RWQCB-SF ESLs considering reasonable exposure pathways. Using a risk-based approach does not necessarily mean that a site is granted closure. However, the risk-based approach can be used to determine whether active remediation is warranted.

Cleanup levels of non-detect for soil and maximum contaminant levels (MCLs) for drinking water are not feasible at the majority of sites including the Site. The fact that there are little or no sites where groundwater containing similar concentrations of dense non-aqueous phase liquid (DNAPL) has been successfully remediated to MCL's supports this conclusion (Cohen and Mercer 1993).

The RWQCB historically considered that groundwater cleanup levels should be established to meet background water quality consistent with the non-degradation goal of the State Water Resources Control Board's Resolution No. 68-16, Statement of Policy With Respect to Maintaining High Quality Waters in California. If this is not achievable numeric concentrations based on protecting beneficial uses can be permitted if it can be demonstrated that: some degradation is in the best interest of the citizens of California; and beneficial uses of the waters are not impaired.

The prevalence of light non-aqueous phase liquid (LNAPL) and DNAPL releases from underground fuel storage tanks has resulted in considerable literature and experience with regard to suitable technologies for remediation of impacted soil and groundwater. The USEPA has recognized that complete groundwater restoration is impractical in areas affected by DNAPL, because there are no proven remedial technologies for completing removing subsurface DNAPL in reasonable timeframes (Cohen and Mercer 1993). The move to risk-based approaches to remedial selection has occurred in part due to a National Research Council review of the performance of conventional pump and treat groundwater systems. The council concluded that at 69 of 77 sites evaluated cleanup goals have not been reached (EPA, 1996). The consulting profession's experience with various remediation options as well as compilations and evaluation of petroleum hydrocarbon releases such as that published by Lawrence Livermore Laboratories (LLNL, 1995), have resulted in general consensus as to the technologies that have proven feasible at petroleum release sites. The LLNL report and the RWQCB have more recently emphasized a risk-based approach to remediation of petroleum hydrocarbon sites because data on numerous release sites indicates that natural attenuation of the petroleum hydrocarbons and CVOCs may be as effective and less costly than many active remedial solutions.

The evaluation of corrective action options is based on a number of factors including property issues (transfers of property), political issues, land use changes, and availability of financial resources. Changes in any of these factors can result in changes in the selected corrective action option.

The following are typical corrective action options that have been utilized at LNAPL and DNAPL sites:

1. Active remediation by injection of air or oxygen to the subsurface;

2. Active remediation by Soil Vapor Extraction and Groundwater sparging;

3. Source excavation of VOC-affected soil;

4. Groundwater extraction and aboveground treatment;

5. Enhanced In-situ biodegradation;

6. In-situ chemical oxidation.

The costs of the various alternatives will vary primarily due to the regulatory agency's clean up level. Generally the technologies are implemented until the concentrations of chemicals remain constant or are leveling out with time. If active remediation is selected then it is important to understand the limitations of the remedial action with respect to the feasibility of meeting a specific cleanup level goal. The expectation of the remedial actions identified above is that concentrations of petroleum hydrocarbons and CVOCs would be significantly reduced until the concentrations become asymptotic with time. The cost/benefits of conducting active remediation utilizing the technologies identified above is expected to be low due to the anticipated small mass of CVOCs and petroleum hydrocarbons reported in onsite soil and groundwater.

9.0 SUMMARY AND CONCLUSIONS

As stated in Section 1, criteria to close low risk sites involves a demonstration that the source of contamination has been removed (i.e., the USTs), the site has been adequately characterized, substances remaining in soil or groundwater do not exceed maximum contaminant levels (MCLs) or other water quality objectives, a plume is not migrating into other sensitive receptors such as water wells or surface water bodies, and that the site does not present a risk to public health or the environment. The Site meets these criteria as summarized in the following subsections.

9.1 Background

AB&I has operated on the Site for approximately 77 years. Business activities include the manufacture of cast pipe and fittings. The facility accepts scrap iron and steel, which it stockpiles on-site, and uses during manufacturing activities. The Site encompasses an area of approximately 11.8 acres. The Site contains various warehouses, manufacturing and office buildings. The entire Site is covered with buildings and asphalt and concrete pavement. Seven USTs were previously located on-site. The USTs included one 8,000-gallon UST used for storing unleaded gasoline and one 8,000-gallon UST used for the storage of mineral spirits and later 1,1,1-trichloroethane (1,1,1-TCA), one 550-gallon UST used for storing regular leaded gasoline, one 10,000-gallon UST used for storing diesel, and three 10,000-gallon USTs used for storing gasoline.

9.2 Hydrogelogic Conditions

The Site is located near the San Francisco Bay within an area identified as the East Bay Plain. The East Bay Plain is situated on the east side of the San Francisco Bay depression. The alluvial sediments of the East Bay Plain consist of a mixture of gravel, sand and clay deposited by coalescing alluvial fans. In the vicinity of the Site, fluvial and near shore deposits have been mapped (Helley et. al., 1979). The fluvial deposits are described as unconsolidated, moderately sorted, fine sand and silt, with clayey silt and occasional thin beds of coarse sand (Muir, 1993). The near-shore deposits are described as a well-sorted, fine to medium grained sand and silt, with lenses of sandy clay and clay. Regional groundwater flow in the vicinity of the Site is interpreted to be towards the west - southwest toward San Leandro Bay.

Although groundwater in the East Bay Plain is generally considered a potential future source of drinking water, there are no permitted drinking water wells within the Site vicinity (SFRWQCB, 1999), nor is the shallow groundwater in this area likely to be used as a public drinking water source in the foreseeable future.

Soils encountered in the unsaturated and saturated zones beneath the Site are predominantly gravelly clay (fill) and silty clay with an interfingered lens of poorly sorted sand and gravel. Shallow groundwater has been observed to occur at the Site at a depth of approximately 4 to 9 feet bgs and flows toward the northwest.

9.3 Distribution and Occurrence of TPH and VOC-Affected Soil and Groundwater

The results of this investigation suggest that residual (low) concentrations of TPHg, TPHd, and related petroleum hydrocarbon chemicals (e.g., BTEX) are present in the vadose (unsaturated) zone in the immediate vicinity of the former USTs. Relatively higher concentrations of TPHg, TPHd, and related petroleum hydrocarbon chemicals (e.g., BTEX) are present in the saturated zone in the immediate vicinity and downgradient of the former USTs. The highest concentration of petroleum hydrocarbon – affected groundwater is present in the Former Three 10,000-Gallon USTs Area and 8,000 gallon mineral spirits/1,1,1-TCA UST area and does not appear to extend off-Site.

TPHd, toluene, and MTBE were reported in samples collected along the eastern Site boundary (Figure 12). The Oakland Truck Stop site is located immediately adjacent to and east of the Site. Releases of petroleum hydrocarbons from the Oakland Truck Stop site have affected underlying soil and groundwater. The presence of TPHd, toluene, and MTBE reported in samples collected along the eastern Site boundary is interpreted to be associated with releases from the Oakland Truck Stop site.

No CVOCs were reported in soil in the area of the former mineral spirits/1,1,1-TCA UST area with the exception of chloroethane reported at a concentration of 0.022 mg/kg at a depth of 5 feet bgs. No CVOCs were reported in deeper soil samples collected between 10 and 20 feet bgs in the area of the former mineral spirits/1,1,1-TCA UST area suggesting CVOCs are limited to shallow groundwater. CVOC-affected groundwater appears to be limited to the area downgradient of the former 8,000-gallon mineral spirits/1,1,1- TCA UST and does not appear to extend offsite.

9.4 Source Removal

The primary contaminant sources, the seven USTs and their contents, were removed from the Site between the period of 1982 and 1993. In addition, TPH and VOC-affected soil located adjacent to the USTs was removed. The migration of TPH and VOC-affected groundwater at the Site is interpreted to occur as a result of shallow groundwater flow. However, natural processes such as adsorption, dispersion, and natural degradation are expected to limit the horizontal and vertical extent of TPH and VOCs. The primary source of the TPH and VOCs, leaks associated with the USTs, have been terminated, therefore the only remaining sources are interpreted to be the affected soil beneath the Site.

The concentrations of TPH and VOCs in soil and groundwater beneath the site are not expected to increase because the source(s) of the releases have been terminated and the Site is paved and covered with structures. Because of these factors, surface water infiltration is not a significant factor in the migration of TPH and VOCs from soil to groundwater, and groundwater quality at the Site has not degraded further since installation and initial groundwater monitoring in 1993.

9.5 Screening Level Risk Evaluation

A screening level risk-based evaluation (SLRE) of chemicals detected in soil and ground water at the Site was conducted using the Tier I approach found in the document titled, "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater," Interim Final - November 2007 (CRWQCB, 2007).

Human exposures for the SLRE were evaluated assuming that the most likely receptors at the Site, under current and future scenarios, are workers. Exposure routes within these scenarios include ingestion, inhalation and dermal contact through direct contact with contaminated media (i.e., the future construction worker scenario) and inhalation (i.e., the current indoor and outdoor commercial/industrial workers operating at the Site). Both the current and future scenarios use the maximum values (i.e., concentrations of TPH and VOCs) for the Site and assume that observed concentrations will not decrease over time, a conservative bias. Groundwater ingestion is not considered in this assessment because contaminated groundwater underlying the Site is not considered suitable for use in the future due to expected limited yield, poor water quality parameters excluding petroleum hydrocarbons and VOCs, and the use of the surrounding area. In addition, there is no evidence that vertical migration has occurred to depths which could affect deeper aquifers, which may be more suitable for potable and non-potable purposes.

Soil gas samples were collected from 10 locations at the Site. Of the ten samples collected, three of the samples did not report concentrations of any VOCs above the laboratory's reporting limits. Of the seven remaining samples, concentrations of chloroethane, BTEX, and PCE were detected. However, none of the VOCs were detected at concentrations in excess of their respective ESLs under either the residential or commercial land-use exposure scenario.

None of the concentrations of TPHg, TPHd, BTEX, and PAHs exceed ESLs for shallow soil under the commercial land use scenario with the exception of the three 10,000 gallon UST Area and the Mineral Spirits/1,1,1- TCA UST Area. TPHd exceeded its ESL in both of these areas and a number of PAHs exceeded their restive ESLs in one soil (tar material) sample collected from the area of the Mineral Spirits/1,1,1-TCA UST Area.

For groundwater no current TPHg, TPHd, and BTEX concentration exceeds its respective ESL where, as here, groundwater is not considered a current or potential drinking water source. If groundwater were a

current or potential drinking water source, the concentration of TPHg, TPHd, and benzene would exceed the RWQCB ESLs.

No CVOCs were detected in soil samples collected as part of this investigation with the exception chloroethane. CVOC-affected groundwater appears to be limited to the area downgradient of the former 8,000 gallon Mineral Spirits/1,1,1-TCA UST and does not extend offsite. The highest concentrations of CVOCs are located in the parking lot area. Review of groundwater monitoring well sampling results indicates that no current CVOC concentration exceeds its respective ESL with the exception of 1,1-DCA and vinyl chloride (located in the Parking Lot Area) where, as here, groundwater is not considered a current or potential drinking water source. If groundwater were a current or potential drinking water source, the concentration of 1,1-DCA, 1,1-DCE, chloroethane, 1,1,1-TCA, and vinyl chloride would exceed the RWQCB ESLs.

ESLs for non-drinking water are based on the protection of vapor intrusion to indoor air. As indicated above, the location of the elevated 1,1-DCA and vinyl chloride concentrations that exceeds ESLs are located in the parking lot area (outdoors) away from any buildings. Further none of the CVOCs in soil gas were identified for the hypothetical indoor commercial/industrial worker receptor above their respective ESL under either the residential or commercial exposure scenario. Therefore, vapor intrusion into indoor air is not expected to constitute a significant threat to the hypothetical indoor commercial/industrial worker receptor.

One or more CAM 17 metals were reported in all samples analyzed for this investigation. Concentrations were compared with regional background metal concentrations to differentiate between metal concentrations present in samples due to ambient conditions and those present as a result of site–related activities. Of the metals detected, only beryllium, chromium, copper, lead, mercury, selenium, thallium, vanadium, and zinc were reported at concentrations in excess of their respective background levels. Of these nine metals, only copper, lead, thallium, and vanadium exceeded their respective ESLs (commercial land-use scenario) in three locations.

In consideration of the above findings and conclusions, it is The Source Group's opinion, that the Site is a low - risk release site. SGI recommends that groundwater monitoring be continued through at least September 2008 to confirm that TPH and VOC concentrations in groundwater are stable or declining. In addition, SGI recommends that a construction risk management plan be developed to ensure the safe and proper handling and disposal practices associated with any future soil excavation, grading, removal, trenching, filling, or earth movement activities that may occur at the Site.

TABLES

Table 1

Well Construction Details[1] and Groundwater Elevation Data for October 2007

AB&I Foundry

Oakland, CA

Well Number	Total Depth[1]	Solid Casing[2]	Screened Interval[3]	Top of Casing (feet, msl[4])	Depth to Water (feet, msl[5])	Groundwater Elevation (feet, msl[6])
MW-1	23	0-10	10.00 - 20.00	7.71	6.26	1.45
MW-2	17	0-8	8.00 - 17.00	NM	NM	Destroyed
MW-2R	20.5	0-5	5.00 - 20.00	5.53	4.27	1.26
MW-3	19.5	0-9	9.00 - 19.00	8.00	7.73	0.27
MW-4	26.5	0-10	10.00 - 25.00	8.59	7.15	1.44
MW-5	20.5	0-5	5.00 - 20.00	8.99	8.53	0.46
MW-6	20.5	0-5	5.00 - 20.00	8.29	9.08	-0.79
MW-7	20.5	0-5	5.00 - 20.00	8.70	6.99	1.71
MW-8	20.5	0-5	5.00 - 20.00	9.30	8.42	0.88
MW-9	20.5	0-5	5.00 - 20.00	6.07	4.27	1.80

Notes:

1) All values describe construction details in feet below ground surface
2) All monitoring wells constructed with 2.00" I.D. schedule 40 PVC;monitoring well MW-2 constructed with 4.00" I.D.schedule 40 PVC
3) All well casing includes .02" slotted screen
4) Top of casing elevation in feet above mean sea level (msl)
5) Depth to water below top of casing (btoc) measured on October 30, 2007
6) Groundwater elevation in feet above mean sea level (msl)

Table 2
Summary of Soil Gas Sample Results
AB&I Foundry
7825 San Leandro Street
Oakland, California

Sample ID	Depth	Sample Matrix	PCE	Chloroethane	Benzene	Toluene	Ethylbenzene	m,p-xylene

SG-9	5	Soil	<0.10	<0.10	<0.080	<0.20	0.56	<0.20
Parking Lot Area								
SG-10	5	Soil	<0.10	<0.10	0.21	0.26	0.28	<0.20

Notes:

(µg/l) - micrograms per liter
PCE - tetrachloroethylene
<0.20 - Not reported at or above laboratory's reporting limit of 0.20 µg/L
1,1,1-TCA - 1,1,1-Trichloroethane
- Samples analyzed using EPA Method 8260B by Airtoxics Laboratories, Folsom, California
RWQCB ESLs - Environmental Screening Levels taken from the California Regional Water Quality Control Board, San Francisco Bay Region document entitled "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater," Interim Final November 2007, commercial use ESLs.
UST - underground storage tank

Notes:

MTBE - Methyl tert butyl ether
(mg/kg) - milligrams per kilogram
TPHg - Total Petroleum Hydrocarbons as Gasoline
TPHd - Total Petroleum Hydrocarbons as Diesel
<0.005 - Not reported at or above laboratory's reporting limit of 0.005 mg/kg
UST - underground storage tank
1,1,1-TCA - 1,1,1-Trichloroethane

-TPHg, BTEX, VOCs and fuel oxygenates analyzed using EPA Method 8260B by Test America Laboratories (TAL), Pleasanton, California

-TPHd analyzed using EPA Method 8015M with silica gel cleanup by TAL, Pleasanton, California

RWQCB ESLs - Environmental Screening Levels taken from the California Regional Water Quality Control Board, San Francisco Bay Region document entitled "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater," Interim Final November 2007, groundwater is not a current or potential source of drinking water.

-Concentrations in bold exceed commercial ESLs for shallow soil (less than 3 meters).

Notes:

(mg/kg) -milligrams per kilogram

<0.067 - Not reported at or above laboratory's reporting limit of 0.067 mg/kg

-Polycyclic Aromatic Hydrocarbons (PAHs) analyzed using EPA Method 8270BC by Test America Laboratories (TAL), Pleasanton, California

RWQCB ESLs - Environmental Screening Levels taken from the California Regional Water Quality Control Board, San Francisco Bay Region document entitled "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater," Interim Final November 2007, groundwater is not a current or potential source of drinking water.

-Concentrations in bold exceed commercial ESLs for shallow soil (less than 3 meters)

Notes:

(µg/L) - micrograms per Liter
(D) - duplicate sample
1,1,1-TCA - 1,1,1-Trichloroethane
UST - Underground Storage Tank
TPHg - Total Petroleum Hydrocarbons as Gasoline
TPHd - Total Petroleum Hydrocarbons as Diesel
MTBE - Methyl tert butyl ether
TBA - Tert butyl alcohol
cis-1,2-DCE - Cis-1,2-dichloroethylene
<0.50 - Not reported at or above laboratory's reporting limit of 0.50 µg/L
NA - Analyte not sampled for

-TPHg, BTEX, VOCs and fuel oxygenates analyzed using EPA Method 8260B by Test America Laboratories (TAL), Pleasanton, California
-TPHd analyzed using EPA Method 8015M with silica gel cleanup by TAL, Pleasanton, California
-Concentrations in bold exceed ESLs for groundwater as a current or potential source of drinking water

RWQCB ESLs[1] - Environmental Screening Levels taken from the California Regional Water Quality Control Board, San Francisco Bay Region document entitled "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater," Interim Final November 2007, groundwater is not a current or potential source of drinking water.

RWQCB ESLs[2] - Environmental Screening Levels taken from the California Regional Water Quality Control Board, San Francisco Bay Region document entitled "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater," Interim Final November 2007, groundwater is a current or potential source of drinking water.

Subject: Fuel Leak Case No. RO0000092 and Geotracker Global ID T0600100065 Additional Site Investigation Report – AB&I Foundry, 7825 San Leandro Street, Oakland, California 94621

Dear Mr Wickham:

AB&I respectfully submits the attached Additional Site Investigation Report for the AB&I Foundry Site located at 7825 San Leandro Street, Oakland, California.

I declare, under penalty of perjury, that the information and/or recommendations contained in the attached document is true and correct to the best of my knowledge.

Sincerely,

AB&I
Dave Robinson
Environmental Manager

1.0 INTRODUCTION

This report presents results of additional investigation of the soil and groundwater conditions at the AB&I Foundry located at 7825 San Leandro Street in Oakland, California (Figure 1; Site). The report has been prepared by The Source Group, Inc. (SGI) on behalf AB&I Foundry (AB&I). The work was conducted in general accordance with the document titled, "*Work Plan for Additional Site Investigation*" (Work Plan), prepared by SGI, dated June 6, 2008. The Work Plan was approved by the Alameda County Department of Environmental Health (ACEH) in a letter, dated July 3, 2008.

2.0 BACKGROUND

2.1 Site Description

The Site is located at 7825 San Leandro Street, east of the intersection with 77th Avenue, in a light industrial area of Oakland (Figures 1 and 2). The Site is bound by commercial/industrial properties to the north, south, east, and west. Union Pacific Railroad tracks are located immediately adjacent to the western edge of the Site. Elmhurst Creek is located at the southeast corner of the Site (Figure 2). San Leandro Bay is located approximately one mile west of the Site.

2.2 Site History and Operations

AB&I has been operating at its present location since at least 1930 (BSK, 1993). Business activities include the manufacture of cast pipe and fittings. The facility accepts scrap iron and steel which it stockpiles on-site, and recycles during manufacturing activities. The Site encompasses an area of approximately 11.8 acres. Previously, seven underground storage tanks (USTs) have been located on-site.

A water supply well is located along southwest perimeter of the Site. Information provided by AB&I indicate that the well is currently used in conjunction with East Bay Municipal Utility District (EBMUD) water as a source of process (cooling) water associated with plant operations.

2.3 Hydrogeological Setting

The Site is located near the San Francisco Bay within an area identified as the East Bay Plain. The East Bay Plain is situated on the east side of the San Francisco Bay depression. The alluvial sediments of the East Bay Plain consist of a mixture of gravel, sand and clay deposited by coalescing alluvial fans. In the vicinity of the Site, fluvial and near shore deposits have been mapped (Helley et. al., 1979). The fluvial deposits are described as unconsolidated, moderately sorted, fine sand and silt, with clayey silt and occasional thin beds of coarse sand (Muir, 1993). The near-shore deposits are described as a well-sorted, fine to medium grained sand and silt, with lenses of sandy clay and clay. Regional groundwater flow in the vicinity of the Site is interpreted to be towards the west - southwest toward San Leandro Bay.

Although groundwater in the East Bay Plain is generally considered a potential future source of drinking water, there are no permitted drinking water wells within one mile of the Site (SFRWQCB, 1999), nor is the shallow groundwater in this area likely to be used as a public drinking water source in the foreseeable future.

Soils encountered in the unsaturated and saturated zones beneath the Site are predominantly gravelly clay (fill) and silty clay with an interfingered lens of poorly sorted sand and gravel to the maximum depth explored (30 feet below ground surface [bgs]). Shallow groundwater has been observed to occur at the Site at a depth of approximately 4 to 9 feet bgs and flows toward the northwest.

Lithologic conditions reported for the Oakland Truck Stop facility located immediately adjacent to and east of the Site indicate that underlying sediments generally include silty clay to a depth of approximately 16 feet bgs, more permeable soil such as silty sand, sandy silt or gravelly sand from 16 feet bgs to 40 feet bgs, and low permeability silty clay from 40 feet bgs to the total depth explored of 50 feet bgs (ASE, 2007).

2.4 Previous Investigations

Various investigations have been conducted at the Site since 1991. Four of the investigations consisted of UST closure reports that were written as part of UST removals conducted at the Site between August 1991 and June 1992. In addition to the four USTs removed in the early 1990s, the three 10,000-gallon USTs were removed in 1982/1983. The USTs removed included:

- Three 10,000-gallon USTs used for storing gasoline (removed 1982/1983);
- 8,000-gallon UST used for storing unleaded gasoline (removed 8/8/91);
- 550-gallon UST used for storing regular, leaded gasoline (removed 8/26/91);
- 8,000-gallon UST initially used for storing mineral spirits and later for storing 1,1,1-trichloroethane (removed 10/4/91); and
- 12,000-gallon UST used for storing diesel fuel (removed 6/3/92).

Additional details regarding the UST removals are presented in the report titled *Site Investigation Report* prepared by SGI, dated February 14, 2008 (SGI 2008a).

In 1993, BSK installed four groundwater monitoring wells (MW-1 through MW-4) to comply with a request by the ACEH for a preliminary assessment of the areas surrounding each of the removed USTs (Figure 2). Between 1993 and 1997, sampling results indicated the presence of petroleum hydrocarbons and chlorinated volatile organic compounds (chlorinated VOCs) in groundwater in the vicinity of the former USTs.

On July 14, 2006, groundwater samples were collected from each of the existing monitoring wells (MW-1, MW-3, and MW-4) and submitted for chemical analysis for polyaromatic hydrocarbons (PAHs) using EPA Method 8270C, total petroleum hydrocarbons as gasoline (TPHg) and total petroleum hydrocarbons as diesel (TPHd) using EPA Method 8015M as well as benzene, toluene, ethylbenzene and xylenes (BTEX) using EPA Method 8020. The three samples were also analyzed for VOCs, including fuel oxygenates

using EPA Method 8260B. Well MW-2 was found to be damaged beyond repair, and therefore was not sampled.

In August 2006, monitoring well MW-2 was destroyed and replaced with well MW-2R (BSK, 2007). In addition, five new groundwater monitoring wells (MW-5 through MW-9) were also installed.

Results of the July/August 2006 sampling event indicated that five of the nine wells had concentrations of at least one compound that exceeded their respective U.S. Environmental Protection Agency (USEPA) maximum contaminant level (MCL) or California Regional Water Quality Control Board – San Francisco Bay Region (CRWQCB-SF) Environmental Screening Levels for groundwater that is a current or potential source of drinking water (ESLs; BSK, 2007).

In October/November 2007, SGI conducted an investigation at the Site to further characterize the extent of petroleum hydrocarbon and chlorinated VOC-affected soil and groundwater associated with the former USTs. TPHg, TPHd, BTEX, methyl tert butyl ether (MTBE), tributyl alcohol (TBA), and chlorinated VOCs were detected in groundwater underlying the Site. Of the constituents detected, only vinyl chloride and 1,1-dichloroethane (1,1-DCA) exceeded their respective ESLs for groundwater where groundwater is not considered a current or potential source of drinking water. A review of historical groundwater data indicated that chlorinated VOC concentrations were stabilized or declining for certain compounds. As a result, SGI concluded that the Site was a low-risk release site and recommended that quarterly monitoring of all nine monitoring wells continue to confirm that concentrations are steady or declining (SGI 2008a).

In February 2008, groundwater samples were collected as part of the quarterly monitoring program required for the Site. Nine wells (MW-1 through MW-9) were sampled as part of the monitoring event. Generally, concentrations of TPHg, TPHd, BTEX, and chlorinated VOCs reported during the sampling event were consistent with those reported during the August 2006 and October 2007 sampling events with the exception of increased concentrations of chlorinated VOCs in well MW-8. SGI concluded that the increased concentrations of chlorinated VOCs reported in samples collected from well MW-8 may be a result of rising water levels since August 2006 (SGI 2008b). Historical groundwater quality data is included in Appendix A.

On March 27, 2008, ACEH issued a letter to AB&I (ACEH 2008a) requesting a work plan to include:

- Preparation of a conceptual site model that evaluates the potential sources, contaminant migration pathways, and potential receptors for the petroleum hydrocarbons and VOCs within the area of and downgradient of the former 8,000 gallon mineral spirits/1,1,1-TCA UST;
- Preparation of a conceptual site model that evaluates the potential sources, contaminant migration pathways, and potential receptors for the petroleum hydrocarbons within the area of and downgradient of the former three 10,000-Gallon USTs dispenser island area;

- Conducting further investigation to define the vertical extent of contamination in the area of the former three 10,000-Gallon USTs, former 550 gallon gasoline UST, and former 8,000 gallon mineral spirits/1,1,1-TCA UST;
- Evaluation of the potential for vapor intrusion to the office building located adjacent to the former 550 gallon gasoline UST Area;
- Evaluation of possible reasons for the discrepancy between soil gas and groundwater sample results in the vicinity of monitoring well MW-8; and
- Submittal of sampling results for VOCs and petroleum hydrocarbons in groundwater from the on-site water supply well.

On June 6, 2008, SGI submitted a work plan titled *Work Plan for Additional Site Investigation* (Work Plan) to ACEH to address the issues listed above (SGI 2008c). The Work Plan was approved by ACEH in a letter dated July 3, 2008 (ACEH 2008b).

3.0 PROJECT OBJECTIVES AND SCOPE OF WORK

3.1 Project Objectives

The objective of this investigation is to fill in data gaps associated with previous investigations conducted at the Site and to further delineate the extent of petroleum hydrocarbon and VOC contamination in groundwater underlying the Site. As indicated in the Work Plan, this data was needed to:

- Assess preferential groundwater flow and contaminant movement;
- Assess the discrepancy between soil gas and groundwater data in the vicinity of well MW-8;
- Evaluated the potential for vapor intrusion to the office building located adjacent to the former 550 gallon gasoline UST;
- Assess potential impacts to the onsite water supply well;
- Confirm that deeper groundwater has not been impacted by Site activities; and
- Evaluate the risk to human health associated with contaminant-affected media.

Additional soil gas data was also needed to assess the potential for vapor intrusion to the office building located adjacent to the former 550 gallon gasoline UST area and to further assess a discrepancy between soil gas and groundwater data in the vicinity of well MW-8.

3.2 Scope of Work

The following tasks were conducted to meet the project objectives:

1. Pre-field activities including permitting;
2. Sampling of all nine groundwater monitoring wells;
3. Soil and groundwater investigation including drilling and sampling 11 soil borings along with the advancement of four Electron Conductivity (EC) borings and five soil gas probes; and
4. Preparation of this report.

3.3 Prefield Activities

Prior to initiating fieldwork a soil boring permit was obtained from the Alameda County Public Works Department. A copy of the permit is included in Appendix B. Underground Services Alert (USA) was also notified to mark utilities.

3.4 Field Activities

3.4.1 Groundwater Monitoring Well Sampling

On June 12 and 13, 2008, groundwater monitoring of the nine Site wells (MW-1, MW-2R, and MW-3 through MW-9) was conducted as part of the ongoing quarterly monitoring activities. Upon arrival at the Site, the wells were located, inspected, and judged to be secure and in good condition. The wells were then gauged for depth to water and total well depth using an electronic water level meter. The water level meter was properly decontaminated between successive wells. Current well gauging data are provided in Table 1 and Appendix C.

Prior to sampling, the wells were purged using low-flow (i.e., low stress) procedures. Purging and sampling was performed using a peristaltic pump with dedicated tubing. Flow rates were generally maintained in the range of 100-200 milliliters per minute. During purging, water quality parameters including pH, temperature, electrical conductivity, ORP, and DO were monitored to ensure that groundwater representative of the aquifer was entering the well. Convergence of these parameters on successive measurements was used as an indicator that the wells had been adequately purged. Copies of the Sampling Field Forms are included in Appendix C.

Nine wells (MW-1, MW-2R, and MW-3 through MW-9) were sampled during the Q2/08 sampling event. Groundwater samples were collected in laboratory-supplied containers, appropriate for the specified analysis. All containers were capped, labeled, placed on ice, and transported under chain-of-custody to the analytical laboratory. All samples were submitted to Advanced Technology Laboratories (ATL), Signal Hill, California and analyzed for VOCs, TPHg, and TPHd using EPA Methods 8260B and 8015M, respectively. One field duplicate sample was also collected from MW-8. An equipment blank and trip blank, analyzed for VOCs as a quality control measure, was also submitted to ATL.

In May 2008, all nine monitoring wells were resurveyed by Virgil Chavez Land Surveying, a California licensed surveyor. The wells were resurveyed to comply and be consistent with the State Water Resources Control Board Geotracker format requirements. Wells were surveyed to a common datum, referenced to mean sea level (msl). Well survey information is included in Table 1.

3.4.2 Soil Gas Survey

On July 7, 2008, soil gas samples were collected to assess the potential for vapor intrusion to the office building located adjacent to the former 550 gallon gasoline UST Area. Ten soil vapor samples were collected at the five locations shown on Figure 3 by TEG of Rancho Cordova, California. All soil vapor samples were collected from discrete depths utilizing a hydraulically-driven probe equipped with detachable drive points. Soil gas samples were collected at depths of five-feet bgs and from just below the concrete slab at a depth of 0.5-feet bgs. Once the drive point reached the target sample, it was

retracted to provide a void space where soil vapor could accumulate. All sample locations were allowed to equilibrate with the sampling probe in place for 30 minutes before soil vapor samples were collected.

Soil vapor samples were collected through polyethylene tubing using a calibrated syringe connected to a sampling port. The samples were immediately transferred to the onsite mobile laboratory for analysis, where they were logged onto the chain-of-custody form and assigned a laboratory identification number. The soil vapor samples were analyzed onsite by Transglobal Environmental Geochemistry (TEG), a California state-certified mobile laboratory, for EPA target list VOCs using EPA Method 8260B. All instrumentation was calibrated by TEG prior to sample collection. During the Investigation, a duplicate soil vapor sample was collected at SG-11.

3.4.2.1 Purge Volume Test

Prior to initiating the soil vapor investigation, tests were conducted to optimize the purge volume. Purge volume tests ensure the following:

- Stagnant or ambient air is removed from the sampling system; and
- Soil vapor samples are representative of subsurface conditions.

Every attempt was made to conduct the purge volume test in an area of suspected elevated contaminant concentrations. For the purge volume test, DTSC and California Regional Water Quality Control Board, Los Angeles Region recommend collecting three soil vapor samples (a soil vapor sample after one (1), three (3), and seven (7) tubing volumes of air are purged). Upon the analysis of each soil vapor sample, an appropriate purge volume can be identified based on the highest concentration for the contaminants detected during the purge volume tests.

Three soil vapor samples were collected at soil boring SG-11 after one (1), three (3), and seven (7) tubing volumes of air were purged. Concentrations of 1,1-DCA and 1,1-DCE were detected in all three samples at relatively similar concentrations. However, toluene was only detected in the sample collected following a single purge volume. The following table summarizes the soil vapor sample results.

Sample ID	SG-11	SG-11	SG-11
Date/Time	7-7-08 / 9:37	7-7-08 / 9:57	7-7-08 / 10:19
Sample Depth	5.0	5.0	5.0
Purge Volume	1	3	7
Units	$\mu g/m^3$	$\mu g/m^3$	$\mu g/m^3$
1,1-DCA	190	190	190

Sample ID	SG-11	SG-11	SG-11
1,1-DCE	150	160	160
Other COCs[1]	230	ND	ND

$\mu g/m^3$ = Micrograms per cubic meter.
1,1-DCA = 1,1 - Dichloroethane
1,1-DCE = 1,1 - Dichloroethene
ND = Not detected.
COC = Chemical of concern.

Based on the results on the second and third purge volume tests, one (1) purge volume was identified as the number of volumes to be applied at all sampling points.

3.4.2.2 Boring Completion

After the soil vapor sampling was complete at each location, the sample rod was removed from the ground and the sampling hole was sealed to surface with neat cement. The remainder of the boring was filled with concrete or asphalt to be consistent with site surface conditions.

3.4.3 Soil and Grab Groundwater Sampling Activities

Between July 8 and 12, 2008, 14 direct-push technology (DPT) boreholes (SB-38 through SB-42 and SB-44 through SGI-52) were advanced by WDC Exploration and Wells, Inc. (WDC) on Site (all locations depicted on Figure 3). As indicated in the Work Plan, the soil borings were originally planned to be advanced using dual wall DPT to a depth of approximately 50 feet bgs. However, refusal or heaving sands were encountered in eleven of the borings (SB-38 through SB-48). To address the refusal and heaving sands issue, four borings (SB-49 through SB-52) were advanced using a direct push electrical conductivity (EC) probe. EC probes use electrical conductivity measurements to define the conductivity of the soil through which the probe passes. Generally, smaller particles like clay and silt exhibit lower permeability and have higher conductivities than that of larger particles such as sand or gravel, which exhibit higher permeability. Utilizing EC boring analysis of soil lithology, water-bearing zones were identified for subsequent groundwater sampling. Dual-wall borings (SB-38 through SB-42 and SB-44 through SB-48) were advanced to a maximum depth of approximately 45-feet bgs and EC borings (SB-49 through SB-52) were advanced to a maximum depth of approximately 60-feet bgs.

<u>Soil Sampling Activities</u>

Soil samples for lithological characterization were collected using the dual wall DPT system continuously to a maximum depth ranging from the surface to approximately 45-feet bgs A total of six soil samples were collected from three of the dual-wall DPT borings (SB-42, SB-44, and SB-45). Soil cores were collected in five-foot long sections of clear, acetate sleeves. Each soil sample consisted of a four to

six-inch long section of the core cut using a hack saw at selected depths for logging and chemical analyses. All soil cores were logged according to Unified Soil Classification System (USCS), including color, moisture content, mottling, and presence of staining or odors. In addition, approximately 20 grams of soil from every 5-foot boring core was screened in the field for VOCs using an organic vapor monitor (OVM) equipped with a photo-ionization detector. Boring and EC logs are included as Appendix D.

Soil samples submitted for chemical analysis were covered with Teflon sheets, capped, labeled and placed on ice for transport following chain-of-custody procedures to ATL and analyzed for TPHg and TPHd using EPA Method 8015M with silica gel cleanup and VOCs using EPA Method 8260B.

Grab Groundwater Sampling Activities

Nine grab groundwater samples, including one duplicate sample, were collected at seven boring locations (SB-38, SB-45, SB-46, and SB-49 through SB-52). Grab groundwater samples were collected from shallow (less than 30 feet bgs) and deep (greater than 40 bgs) groundwater bearing zones. For the deeper samples, high to moderate permeability soils were targeted for groundwater collection. Shallow groundwater samples were only collected from borings advanced in areas in which no shallow groundwater data existed. Shallow groundwater samples were collected from borings SB-38, SB-45, and SB-47 at depths of 25, 20, and 24 feet bgs, respectively. Deep groundwater samples were collected from borings SB-45, SB-46, SB-49, SB-50, SB-51, and SB-52 at depths of 45, 48, 42, 58, 44, and 51-feet bgs, respectively.

To collect groundwater at each location, samples were collected by one of two methods. If both shallow and deep groundwater samples were required from a boring location, one sample was collected through the dual wall DPT casing via a small diameter temporary polyvinyl chloride (PVC) well screen inserted into the borehole. Groundwater samples were then collected by placing a polyethylene tube with a bottom check valve into the screen. The tubing was gently moved up and down to minimize volatilization, resulting in water flow through the check valve and tubing to the ground surface. For the second sample, in order to minimize the potential for cross contamination, a second borehole was advanced and groundwater was collected via a Hydropunch sampler equipped with a retrievable stainless steel screen and expendable tip. In the cases where a Hydropunch sampler was used, higher permeable zones were selected based on the review of the adjacent boring logs and/or EC logs.

Groundwater samples submitted for chemical analysis were capped with Teflon septa, labeled, and placed on ice for transport to ATL under chain-of-custody procedures. Groundwater samples were analyzed for VOCs using EPA Method 8260, TPHg and TPHd using EPA Method 8015M with silica gel cleanup.

At the completion of boring activities, all borings were grouted with neat cement, immediately following sampling, from the bottom up using a tremmie pipe.

3.4.4 Decontamination Procedures

Disposable sampling equipment, such as small tools, hoses, and disposable gloves, were disposed of after each use. Equipment that was reused during sampling activities was decontaminated prior to additional sampling. The decontamination procedure consisted of:

- Wash in a phosphate-free soap and water mixture;
- Rinse thoroughly in distilled water following washing; and
- Final rinse using distilled water.

3.4.5 Investigation-Derived Waste Management

Investigation derived waste (IDW) were placed in labeled and sealed DOT-approved 55-gallon drums for temporary storage at the Site. IDW consisted of soil cuttings, decon water, and purge water. IDW will be properly disposed of in accordance with the applicable Federal, State, and local regulations.

4.0 FIELD INVESTIGATION RESULTS

4.1 Soil Conditions

Soil encountered during this investigation consisted primarily of clay with interbeds of silt, silty sand, sands, and gravelly clays. The upper 3 to 4-feet of soil at the Site consists of an artificial fill. Beneath the artificial fill, in most locations, is a 5 to 10 foot thick silty clay/clay layer. Underlying the parking lot, a 3 to 4 foot layer of gravelly clay was observed at a depth of 15 feet bgs. At a depth of 32 feet underlying the location of the former 1,1,1-TCA UST and extending into the parking lot area, an approximately 7-foot thick layer of medium-grained sand was observed. Below this, a 15-foot thick layer of clay was observed. At 55 feet bgs, gravelly sand was encountered. In the borings advanced in the location of the former three 10,000-gallon USTs, a gravel layer was observed at approximately 21-feet bgs. Geologic cross sections are illustrated in Figures 4 through 6. A cross section location map is presented in Figure 3.

4.2 Groundwater Flow and Gradient

On June 12, 2008, the depth to groundwater was measured in monitoring wells MW-1 through MW-9. Groundwater elevations ranged from approximately 3.84 feet mean sea level (msl) in MW-7 to 1.52 feet msl in MW-6. The water level elevation in each well was calculated by subtracting the depth-to-water measurements from the top of casing elevations. The measured depths to water and the calculated water level elevations are summarized in Table 1.

The groundwater elevations were used to calculate the groundwater gradient and flow direction. Based on the groundwater elevation contours, groundwater is generally flowing towards the northwest. The magnitude of the lateral hydraulic (groundwater) gradient was approximately 0.005 ft/ft. A potentiometric surface map for June 2008 is presented as Figure 7.

4.3 Soil Gas, Soil, and Groundwater Sample Results

4.3.1 Soil Gas Results

On July 7, 2008, ten soil gas samples were collected at five different locations by TEG to assess the potential for vapor intrusion to the office building located adjacent to the former 550-gallon gasoline UST Area. Four of the locations were on the ground floor of the warehouse, which is situated adjacent to the offices (Figure 7). The fifth soil gas sample location was advanced near well MW-8 to assess the discrepancy between the previous groundwater and soil gas sampling results. Of the four sample locations in the warehouse, two had no detectable concentrations of any compounds above laboratory

reporting limits. Of the two remaining locations, vinyl chloride was detected at a concentration of 2.1 µg/L in soil gas sample SG-12. Tetrachloroethene (PCE), trichloroethene (TCE), and m,p-xylnes were detected in sample SB-16A at concentrations of 0.2, 0.14, and 0.22 µg/L, respectively. In sample SG-16B collected from the same location as SB-16A but from a depth of 5-feet bgs, PCE, benzene, and vinyl chloride were detected at concentrations of 0.58, 0.17, and 3.7 µg/L, respectively. In the soil gas sample collected from the parking lot near well MW-8 (SB-11), 1,1-DCE, 1,1-DCA, and toluene were detected at concentrations of 0.15, 0.19, and 0.23 µg/L, respectively. Soil gas sample results are summarized in Table 2 and shown on Figure 8. Laboratory chemical analysis reports are included in Appendix E.

4.3.2 Soil Analytical Results

A total of six soil samples from three borings (SB-42, SB-44, and SB-45) were collected for the purpose of evaluating soil conditions in the vicinity of the warehouse and the vertical extent of contamination in the area of the former 550 gallon UST. Of the three borings, only two (SB-44 and SB-45) had samples with concentrations of contaminants of laboratory practical quantitation limits (PQLs). Sample SB-42-40 collected from boring SB-42 in the vicinity of the 550-gallon gasoline UST at a depth of 40 feet bgs had no compounds above laboratory PQLs. Of the two remaining borings, only four out of the five samples collected had concentrations of contaminants above laboratory PQLs. Of the two soil samples collected from boring SB-44 at depths of 15 feet bgs and 25 feet bgs, the 15-foot sample had much higher concentrations of TPHg, TPHd, benzene, isopropylbenzene, n-butylbenzene, and sec-butylbenzene compared to the 25-foot sample. In the 25-foot sample collected from boring SB-44, only TPHg and TPHd were detected at concentrations of 0.22 and 1.1 mg/kg, respectively. Two of three soil samples collected from boring SB-45 (SB-45-15 and SB-45-20), had concentrations of TPHg (66 and 360 mg/kg, respectively), and only sample SB-45-20 had concentrations of n-butylbenzene (0.25 mg/kg). The shallow sample, SB-SB45-5, had no compounds above laboratory PQLs. Soil sample results are summarized in Table 3.

4.3.3 Groundwater Analytical Results

Between July 8 and July 12, 2008, nine grab groundwater samples were collected to assess the vertical extent of TPH and VOC-impacted shallow and deep groundwater underlying the Site and to evaluate the potential for contaminated groundwater to impact the water supply well located on-site. In addition, all nine monitoring wells were sampled on June 11 and June 12, 2008. As indicated in Section 3.4.3, grab-groundwater samples were collected from two discrete zones, shallow (less than 30 feet bgs) and deep (greater than 40-feet bgs) groundwater zones. The following is a summary of the results by areas of concern (AOCs; Figure 2)). A summary of the samples collected and the results are included as Tables 4 and 5 and shown on Figures 9 and 10.

Former Three 10,000-Gallon USTs Area

Shallow zone groundwater samples were collected from well MW-9 and from borings SB-45 and SB-47 at depths of 20 and 24 feet bgs, respectively. Results from the sample collected at well MW-9 are generally consistent with historical results except for the presence of 1,1-DCE at a concentration of 1.4 µg/L, which was not reported above laboratory PQLs during the first quarter 2008 (Q1/08) sampling event. Groundwater in the vicinity of MW-9 continues to be impacted by TPHg, TPHd, BTEX, and naphthalene at concentrations ranging from 2,900 µg/L for TPHg to 2.1 µg/L for total xylenes. In addition, concentrations of n-propylbenzene, isopropylbenzene, and n-butylbenzene, detected in sample MW-9 during the Q1/08 sampling event, were not detected at or above laboratory PQLs during this sampling event. In the shallow groundwater sample collected from boring SB-45, concentrations of all compounds were at or below laboratory PQLs except for TPHg, which was detected at a concentration of 640 µg/L. In the shallow groundwater sample collected from boring SB-47, concentrations of all compounds were at or below laboratory PQLs except for TCE, which was detected at a concentration of 0.62 µg/L.

Three deep groundwater samples were collected from borings SB-45, SB-46, and SB-51 at depths of 45, 48, and 44 feet bgs, respectively. In the deep groundwater sample collected from boring SB-46, all compounds were at or below laboratory PQLs. TPHg, TPHd, and benzene were detected from the sample collected at boring SB-45, and TPHg, ethylbenzene, toluene, xylene, naphthalene, while a number of chlorinated VOCs were detected in the sample collected from boring SB-51.

Parking Lot Area

Shallow groundwater samples were obtained from wells MW-3, MW-5, MW-6, and MW-8. Results from groundwater samples are generally consistent with historical results. The main contaminants in all three wells located in the Parking Lot Area are chlorinated VOCs, mainly 1,1,1-TCA, 1,1-DCA, 1,1-DCE, chloroethane, and vinyl chloride. Concentrations are the highest in the sample collected from MW-8, the well closest to the suspected source area, the 1,1,1-TCA/Mineral Spirits UST. Concentrations of 1,1-DCA, 1,1-DCE, chloroethane, 1,1,1-TCA, and vinyl chloride detected in the sample from well MW-8 were 1,400, 3,200, 300, 2,700, and 19 µg/L, respectively. During the Q1/08 sampling event, TPHd was detected in the sample collected from well MW-8 at a concentration of 140 µg/L. However, during this sampling event, TPHd concentrations were below laboratory PQLs. For the samples collected in the other three wells, MW-3 had the second highest concentrations of chlorinated VOCs, followed by MW-5. The sample collected from well MW-6 had no chlorinated VOCs above laboratory PQLs. However, this sample was the only sample collected from the Parking Lot Area that had detectable levels of TPHd (54 µg/L). The cleanest well, well MW-6, is located downgradient of well MW-8 and near the northern boundary of the Site, suggesting that is unlikely that chlorinated VOCs are migrating offsite.

One deep groundwater sample was obtained from boring SB-49, located adjacent to well MW-8, at a depth of 42 feet bgs. No compounds exceeded laboratory PQLs except for 1,1-DCA, which was

detected at a concentration of 0.39 µg/L. However, the laboratory approximated this value as it between the PQL and calculated method detection limit (MDL). Based on the general lack of chlorinated VOCs detected in deep groundwater, it is unlikely that chlorinated VOC-affected groundwater from the shallow zone is impacting deeper groundwater in this area.

Former 8,000-Gallon Mineral Spirits/1,1,1-TCA UST

One shallow groundwater sample was obtained from well MW-2R. Shallow groundwater in the vicinity of well MW-2R had detectable levels of TPHg and 1,1-DCE at concentrations of 98 and 0.68 µg/L, respectively. TPHg concentrations are generally consistent with historical results. However, the absence of TPHd and the presence of 1,1-DCE during the sampling event are not. During the last sampling event, TPHd was detected in the groundwater sample collected from well MW-2R at a concentration of 200 µg/L whereas 1,1-DCE was not detected above laboratory PQLs. During this event, no TPHd was detected above PQLs. However, 1,1-DCE was detected just above PQLs at a concentration of 0.68 µg/L.

One deep groundwater sample was collected from boring SB-50, located adjacent to well MW-2R, at a depth of 58 feet bgs. Results from the sample indicate that deep groundwater in the vicinity of boring SB-50 contains TCE and naphthalene at concentrations of 6.3 and 1.5 µg/L, respectively.

Water Supply Well Area

Shallow groundwater was obtained from boring SB-38 at a depth of 25 feet bgs. Shallow groundwater collected from boring SB-38, located just north of the water supply well, had detectable concentrations of TPHg, 1,1-DCA, 1,1-DCE, cis-1,2-DCE, TCE, and vinyl chloride.

One deep groundwater sample was obtained from boring SB-52 at a depth of 51 feet bgs. Boring SB-52 is located north of the water supply well, adjacent to boring SB-38. Results from the sample indicate that deep groundwater in the vicinity of boring SB-52 contains 1,2-DCA at a concentration of 2.2 µg/L. None of the compounds detected in shallow groundwater samples were detected in the deeper sample.

5.0 CONCEPTUAL SITE MODEL AND ENVIRONMENTAL SCREENING LEVELS

This section presents a description of the conceptual site model (CSM) and environmental screening levels (ESLs) used to assess the risk associated with contaminated media at the Site.

5.1 Conceptual Site Model

In order to develop a conceptual understanding for the Site and to evaluate impacts to human and ecological health from contaminated media, information regarding potential chemical sources, chemical release and transport mechanisms, locations of potentially exposed human receptors, and potential exposure routes must be assessed. The CSM associates sources of chemicals with potentially exposed human and ecological receptors along with associated complete exposure pathways.

5.1.1 Potential Sources

The potential source(s) of contaminants released into the environment are interpreted to be leaks associated with the operation of the former three 10,000-Gallon USTs, the former 8,000-gallon mineral spirits/1,1,1-TCA UST, the 550 gallon gasoline UST, and the 12,000 gallon diesel UST.

The migration of TPH and chlorinated VOCs at the Site is interpreted to occur as a result of groundwater flow. However, natural processes such as adsorption, dispersion, and natural degradation are expected to limit the horizontal and vertical extent of TPH and chlorinated VOCs. The primary source of the contaminants, leaks associated with discharges of TPH and chlorinated VOCs from the UST systems, have been terminated. Therefore, the only remaining sources are interpreted to be the affected soil beneath and downgradient of the USTs.

5.1.2 Contaminant Migration Pathways

TPH tends to sorb to soil particles and can be transported from surface soils at the Site via dust generation or in surface water runoff. More volatile organic chemicals detected at the Site (e.g., chlorinated solvents or gasoline-range petroleum hydrocarbons) would not be expected to be present in surface soils, but can migrate downward from shallow soils to deeper soils under the force of gravity. These volatile chemicals could also migrate upward through soil gas into the atmosphere. In addition, these types of chemicals can migrate to underlying groundwater through leaching.

5.1.3 Potential Receptors and Exposure Pathways

As discussed in SGI's report, "Site Investigation Report", the exposure pathways identified to be complete and significant for the Site include:

- Hypothetical Onsite Outdoor Commercial/Industrial Worker Receptor (current and future exposure scenario);
- Hypothetical Onsite Indoor Commercial/Industrial Worker Receptor (current and future exposure scenario); and
- Hypothetical Onsite Construction Worker Receptor (current and future exposure scenario).

The exposure pathways assumed to be complete and significant for the hypothetical outdoor and indoor commercial/industrial worker receptor include:

- Inhalation of vapors in outdoor air volatilizing from the subsurface.

For the purpose of evaluating risk, the onsite water supply well was evaluated as a potential receptor in the event that there is a connection between the impacted shallow groundwater and deeper groundwater from which the well produces.

5.2 Environmental Screening Levels

ESLs were developed for soil gas, soil, and groundwater for chemicals commonly found at sites impacted by releases of hazardous substances. The ESLs are presented in the document titled, "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater," Interim Final - November 2007 updated May 2008 (CRWQCB, 2007).

The CRWQCB-SF ESLs include a broad scope of screening levels, some of which are not strictly risk-based. The risk-based ESLs correspond to an excess cancer risk of 1×10^{-6} or a hazard quotient of 0.2, based on standardized equations (CRWQCB, 2008) that combine exposure assumptions with agency-derived toxicity data. The risk-based ESLs are developed for direct contact with soil exposure scenarios (i.e., ingestion, dermal contact, and inhalation of dust/vapor in outdoor air) and indoor air exposure scenarios.

The ESLs were developed to address environmental protection goals presented in the Water Quality Control Plan for the San Francisco Bay Basin (RWQCB 2006). These goals include:

<u>Surface Water and Groundwater:</u>

- Protection of drinking water resources;
- Protection of aquatic habitats;
- Protection against vapor intrusion into buildings; and
- Protection against adverse nuisance conditions.

Soil:

- Protection of human health (direct-exposure);
- Protection against vapor intrusion into buildings;
- Protection against leaching and subsequent impacts to groundwater;
- Protection of terrestrial biota; and
- Protection against adverse nuisance conditions.

The RWQCB's ESL document includes an approach that presents target screening levels for use in assessing whether a more detailed site-specific risk assessment and/or site remediation is warranted. ESL concentrations are based on exposure pathways (e.g., ingestion, dermal contact with soil and inhalation) for specific land-use conditions, including impacts to groundwater and ecological receptors.

The soil ESLs for groundwater protection (soil leaching) were developed to address potential leaching of chemicals from vadose zone soils and subsequent impact on groundwater. Soil impacts are limited to the onsite areas. Therefore, any leaching potential from the vadose zone into groundwater is limited to the onsite areas. However, the greater lateral extent and highest concentrations of the VOCs in soil lie within the saturated zone (SGI, 2007). Therefore, the saturated zone and groundwater beneath the Site are already impacted. Due to minimal VOC mass in the vadose zone and greater VOC mass in the saturated zone, ESLs for the protection against leaching into groundwater were not relevant to the Site.

The urban area ecotoxicity criteria provided in the ESL document were intended for the protection of terrestrial biota under various land use scenarios, including residential, agricultural, and parkland. The Site is zoned commercial/industrial and includes industrial facilities, office buildings, streets, and parking lots (Section 2.1). It is very unlikely that these areas support any relevant terrestrial habitat. Therefore, the urban area ecotoxicity criteria are not applicable to the Site.

As indicated previously, there are no known active domestic water supply wells pumping from shallow aquifers for beneficial use within a 1-mile radius of the Site. Therefore, ESLs for the protection of drinking water resources were not applicable to the Site.

The nearest surface water body is Elmhurst Creek, which bounds the southern edge of the Site. Elmhurst Creek is channeled through urban areas and drains stormwater toward San Leandro Bay (approximately 1 mile from the Site). The nearest wildlife refuge (Don Edwards) is approximately 30 miles southeast of the Site. There is no evidence of interaction between contaminants in groundwater and regional surface water features, due to the distance from the Site to the point of potential interception. Therefore, aquatic habitat goals are not applicable to the Site.

For this analysis, the risk-based CRWQCB ESLs (CRWQCB, 2007) were used exclusively. These ESLs represent conservative screening values below which adverse effects on human health are not expected

to occur. ESLs are currently available for the indoor commercial/industrial worker receptor potentially exposed to chemicals via inhalation of vapor in indoor air exposure pathways, and for the outdoor commercial/industrial receptor potentially exposed to chemicals via direct contact exposure pathways. Compounds in which the highest detected concentrations exceeded ESLs were identified as contaminants of potential concern (COPCs). The soil gas, soil, and groundwater screening levels used in this analysis are summarized in Tables 2, 3, and 4 through 5, respectively. A comparison of Site data screened against selected ESLs is provided in the following section.

6.0 EVALUATION OF FINDINGS

As mentioned in Section 3.1, the goal of this investigation related to TPH and VOC contaminants in soil and groundwater underlying the Site were to:

- Assess the discrepancy between soil gas and groundwater data in the vicinity of well MW-8;
- Evaluate the potential for vapor intrusion into the office building located adjacent to the former 550 gallon gasoline UST;
- Assess potential impacts to the onsite water supply well;
- Confirm that deeper groundwater has not been impacted by Site activities; and
- Evaluate the risk to human health associated with contaminant-affected media.

Evaluation of the discrepancy between soil gas results and groundwater data in the vicinity of well MW-8.

During the October/November 2007 investigation, soil gas sample SG-10 collected near well MW-8 contained benzene, toluene, and ethylbenzene at concentrations of 0.21, 0.26, and 0.28 µg/l, respectively (SGI 2007). However, groundwater collected from well MW-8 has never contained benzene, toluene, or ethylbenzene at concentrations above laboratory PQLs (SGI 2007, 2008). The most recent soil gas sample collected from the vicinity of well MW-8 (SG-11) did not have concentrations of benzene or ethylbenzene above laboratory reporting limits but did have toluene at a concentration of 0.23 µg/L. One possible reason for the discrepancy between soil gas and groundwater sample results of monitoring well MW-8 could be related to the difference in laboratory reporting limits between groundwater samples and soil gas samples. Laboratory PQLs for VOCs in groundwater samples collected at well MW-8 during past sampling events were 5 and 0.5 µg/L for the November 2007 and June 2008 sampling events, respectively. Both reporting limits were higher than the concentrations at which benzene, toluene, and ethylbenzene were detected in soil gas sample SG-10 and at which toluene was detected in soil gas sample SG-11. Due to higher laboratory reporting limits in groundwater samples, benzene, ethylbenzene, and toluene could be present in shallow groundwater in the vicinity of well MW-8 at concentrations below PQLs but at high enough concentrations to be detected soil gas samples collected just above the water table at approximately 5 feet bgs.

Evaluation of the potential risk to indoor air for vapor intrusion into the office building located downgradient of the 550 gallon gasoline UST

The layout of the office building is shown in Figure 8 and shows that the ground floor area of the building is located closest to the former 550 gallon gasoline UST is used for storage and inventory control. The south facing side of the ground floor is completely open to the outside environment. Though it does not represent an indoor environment, it will be treated as such for this evaluation. Other adjacent areas

include storage, the employee break room, two offices (human resources [HR] and safety), and the employee locker room. The main office facilities are located on the second floor overlying these areas.

The Site and surrounding areas are currently zoned for commercial/industrial use and they are expected to remain as such in the future. As discussed in section 5.3, the potential receptor relevant to the office building is the hypothetical indoor commercial/industrial worker. The hypothetical indoor commercial/industrial worker is a long-term receptor (i.e., 7 years to a lifetime [USEPA, 1989]) and is assumed to represent a full-time employee that spends 250 days per year at work (i.e., 5 days per week, 50 weeks per year [2 weeks per year are assumed to be spent away from the Site]). The exposure duration for this receptor is 25 years. This receptor spends the workday indoors performing light office duties and has limited to no direct contact with outdoor soils. With the exception of the HR and safety office, the ground floor level is currently used by employees on a sporadic basis. Therefore, ESLs for vapor intrusion into indoor air were used for this evaluation.

Of the four sample locations located in the office building, two sample locations (SG-13 and SG-14) had no detectable concentrations of any compounds. Samples collected from the remaining two locations in the office building and detectable concentrations of PCE, TCE, vinyl chloride, and m,p-xylene. The concentrations of PCE detected in soil gas sample SG-16A at a depth of 0.5 feet below the concrete slab was above its respective ESL under both the residential and commercial exposure scenario. Vinyl chloride was identified at both the SG-16B location in the sample collected from a depth of 5-feet bgs and at the SG-12B location, also collected from a depth of 5-feet bgs. Both vinyl chloride concentrations were above their respective ESL under both the residential and commercial exposure scenarios. The presence of higher concentrations of PCE in shallow soil gas samples, along with the presence of daughter products from the breakdown of PCE in deeper soil gas samples, is interpreted by SGI to be related to isolated surface spills and unrelated to groundwater. None of the groundwater samples collected during past sampling events in the upgradient well, MW-4, had detectable concentrations of PCE or vinyl chloride. Furthermore, the presence of PCE, TCE, and vinyl chloride appear to be confined to the two sample locations collected within 4 feet of each other along the western portion of the warehouse (SB-12 and SB-16). Therefore, although the current maximum concentrations of PCE and vinyl chloride in soil gas exceed the ESLs, they are interpreted be localized and possibly related to surface spills. Soil gas ESLs are summarized in Table 2.

Nature and extent of impacted soil in the vicinity of the 550-Gallon gasoline UST

During this investigation, soil data was collected from three locations (SB-42, SB-44, and SB-45). The exposure pathways considered potentially complete and significant at the Site included direct contact with soil while performing soil invasive activities. The exposure receptor identified includes the hypothetical construction worker receptor and the hypothetical outdoor commercial/industrial worker receptor, future use scenario. Depth to the shallow water-bearing zone is approximately 6 feet bgs. During this investigation, six soil samples (SB-42-40, SB-44-15, SB-44-25, SB-45-5, SB-45-15, and SB-45-20) were collected onsite.

With the exception of two samples none exceeded the deep soil (>3 meters) CRWQCB ESL for both the residential and commercial land use exposure scenario. Only TPHg concentrations in soil sample SB-45-20 and TPHd concentrations in soil sample SB-44-15 exceeded the CRWQCB deep soil ESL for commercial land use of 180 mg/kg. However, both samples were collected within the groundwater zone. Therefore, the presence of TPHg and TPHd in soil is interpreted to be the result of absorption of TPHg and TPHd from affected groundwater and not from another source area.

Evaluation of potential impacts to the onsite water supply well

As indicated in section 2.4, ACEH requested that AB&I submit available sampling results for VOCs and petroleum hydrocarbons in groundwater from the onsite water supply well. AB&I participated in the Ground-Water Ambient Monitoring and Assessment (GAMA) program currently being implemented by the State Water Resource Control Board in coordination with the U.S. Geological Survey and Lawrence Livermore National Laboratory. Groundwater samples were collected from the onsite water supply well in June 2007 and analyzed for VOCs and other water quality parameters. The results of the organic analyses identified the presence of low concentrations (<2 ug/L) of PCE, TCE, and cis-1,2 DCE. The onsite water supply well produces water from depths greater than 300 feet bgs. The absence of chemicals used at the Site, (e.g., 1,1-DCA, 1,1-DCE, and 1,1,1-TCA) in the sample collected from the water supply well and the depths from which the well produces water, suggests that the presence of the VOCs in the water supply well groundwater sample is likely related to other regional, off-site sources of contamination.

Evaluation of potential Impacts to deep groundwater

TPHg, TPHd, 1,2-DCA, TCE, cis-1,2-DCE, and vinyl chloride were detected in deep groundwater underlying the Site. Of those compounds, TPHg, TPHd, TCE, cis-1,2-DCE, and vinyl chloride were also detected in shallow groundwater at the Site. Of the compounds detected in deep groundwater, one compound, 1,2-DCA, has never been detected in shallow groundwater at the Site. Based on the detection of contaminants in deep groundwater also found in shallow groundwater at the Site, contaminants from shallow groundwater may be affecting deep groundwater. However, the presence of 1,2-DCA in deep groundwater and its absence in shallow groundwater, suggests that offsite sources of contamination may also be contributing to deep groundwater impacts.

Sample results from deep groundwater samples were screened against ESLs for groundwater that is not a current or potential source of drinking water. Based on the results, none of the samples had ESL exceedences.

Discussion of shallow groundwater conditions

Shallow groundwater underlying the Site continues to be affected with chlorinated VOCs and TPH at concentrations that are generally stable and consistent with historical results. Groundwater downgradient

of the three former 10,000-gallon diesel USTs is impacted with TPHg, TPHd, and BTEX. Shallow groundwater in the vicinity of the former 8,000-gallon Mineral Spirits/1,1,1-TCA UST is impacted by TPHg and 1,1-DCE. However, TPHd was not detected in shallow groundwater in the vicinity of well MW-2R during the most recent sampling event. Chlorinated VOCs present in the groundwater underlying the parking lot in the vicinity of well MW-8 continue contain the highest concentration of chlorinated VOCs on the Site, which is interpreted by SGI to be related to a release from the former 8,000-Gallon Mineral Spirits/1,1,1-TCA UST, located upgradient of well MW-8. Peripheral wells (MW-3, MW-5, and MW-6) located in the parking lot have lower concentrations of chlorinated VOCs compared to MW-8. MW-6, located downgradient of well MW-8 and near the northern boundary of the Site, had no detectable concentrations of chlorinated VOCs. Shallow groundwater in the vicinity of boring SB-38 at a depth of 25 feet bgs had detectable concentrations of TPHg and chlorinated VOCs, suggesting that contaminant-affected groundwater may be migrating south towards the water supply well in the shallow groundwater zone. A review of lithology underlying the parking lot reveals a gravelly clay layer at a depth of 12 feet bgs to 16 feet bgs. A gravelly clay layer was also observed at boring SB-38 at a depth of 15 to 17 bgs (Figure 6), indicating that a shallow groundwater path may be present. However, deep groundwater in the vicinity of the water supply well is not affected with the same chlorinated VOCs observed in the shallow groundwater zone suggesting that the water supply well is unlikely to be drawing down contaminants from the shallow groundwater zone.

Evaluation of risk - Shallow Groundwater

During the June/July 2008 investigation, monitoring well and grab groundwater samples were collected. However, due to the presence of suspended sediments in grab groundwater samples, concentrations of contaminants in these samples are biased high. Therefore, only groundwater data from samples collected from monitoring wells are evaluated. Groundwater COPCs were identified by a comparison between maximum detected concentrations in groundwater and appropriate groundwater ESLs.

As mentioned in section 5, ingestion and dermal contact of groundwater is not considered to be a significant and complete exposure pathway for any of the receptors under the current use scenario. The inhalation of vapors in indoor air generated from contaminant-affected groundwater is considered the only significant and complete exposure pathway. Therefore, groundwater ESLs for vapor intrusion to indoor air were used for this evaluation.

The only complete and significant exposure pathway for the indoor commercial/industrial worker is the inhalation of vapors in indoor air volatilizing from the subsurface. No COPCs were identified for the hypothetical indoor commercial/industrial worker receptor in any of the former UST areas with the exception of the Parking Lot Area. For the Parking Lot Area, only vinyl chloride was identified as a COPC in groundwater for the hypothetical indoor commercial/industrial worker receptor. Of the four groundwater monitoring wells located in the Parking Lot Area, vinyl chloride exceeded its respective ESL in the sample collected from monitoring wells MW-3 and MW-8 (Figure 9). Monitoring wells MW-3 and MW-8 are located in the parking lot area away from any buildings. Therefore, vapor intrusion into indoor

air is not expected to constitute a significant risk to the hypothetical indoor commercial/industrial worker receptor under the current exposure scenario. However vapor intrusion into indoor air may constitute a risk to the hypothetical indoor commercial/industrial worker receptor under the future exposure scenario.

7.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the review of current and historical data obtained from soil gas, soil, and groundwater sampling, it is SGI's opinion that the extent of contaminant-affected soil and groundwater, and the risk associated with contaminant-affected media for the Site, has been adequately defined. Results from current and previous soil data indicate that the source areas have been removed and residual soil contamination is likely the result of absorption of contaminant mass from the saturated zone. TPH and chlorinated VOCs are present in shallow groundwater underlying the Site. Based on a comparison of Site data against ESLs for the identified exposure receptor, the hypothetical indoor commercial/industrial worker, no exceedences were identified. However, groundwater collected from two wells located in the parking lot had concentrations above ESLs for vinyl chloride, indicating that vapor intrusion into indoor air may constitute a risk to the hypothetical indoor commercial/industrial worker receptor under the future exposure scenario. Soil gas collected in the vicinity of the office building had exceedences in two locations for vinyl chloride at 5-feet bgs and for PCE in one location at 0.5-feet bgs. Based on the location and nature of contaminants, the presence of both compounds is interpreted by SGI to be related to surface spills and unrelated to contaminant-affected groundwater.

Deep groundwater underlying the Site contains concentrations of TPH and low concentrations of chlorinated VOCs, none of which are at concentrations that exceed ESLs. The presence of these compounds is interpreted by SGI to be related to a combination of site activities and onsite migration from offsite sources. Samples collected from the water supply well did not reveal the presence of a number of chlorinated VOCs detected in shallow groundwater at the Site (e.g., 1,1-DCA, 1,1-DCE, and 1,1,1-TCA) indicating that it is unlikely that contaminant-affected groundwater at the Site has impacted the water supply well.

Based on ESL exceedences in groundwater for the hypothetical indoor commercial/industrial worker receptor under the future exposure scenario, ESL exceedences for vinyl chloride and PCE in soil gas underlying the office building, and the potential for exposure of the hypothetical onsite construction worker receptor to affected media, SGI recommends the following:

- An additional soil gas survey from beneath the concrete slab located in the break room and adjacent areas of the office building to confirm that PCE and vinyl chloride exceedences in soil gas samples are localized and do not pose a threat to indoor air quality;
- The development of a risk management plan to address human health risks associated with the hypothetical indoor/outdoor commercial/industrial worker receptor under the future exposure scenario and the hypothetical onsite construction worker receptor under the current and future exposure scenarios; and
- An administrative control in the form of a deed restriction be implemented as part of Site closure. The deed restriction would specify that the area of soil and groundwater impact would limit the

Site to commercial use. The deed restriction would follow a format acceptable to ACEH and run with the land indefinitely.

Subject: Fuel Leak Case No. RO0000092 and Geotracker Global ID T0600100065 Supplemental Soil Vapor Investigation Report, AB&I Foundry, 7825 San Leandro Street, Oakland California 94621

Dear Mr. Wickham:

AB&I respectfully submits the attached Supplemental Soil Vapor Investigation Report for the AB&I Foundry Site located at 7825 San Leandro Street, Oakland, California.

I declare, under penalty of perjury, that the information and/or recommendations contained in the attached document are true and correct to the best of my knowledge.

Sincerely,

Dave Robinson
Engineering Manager

1.0 INTRODUCTION

This document presents the results of a supplemental soil vapor investigation conducted at the AB&I Foundry (AB&I) facility, located at 7825 San Leandro Street, in Oakland, California (the Site, Figure 1). This Supplemental Soil Vapor Investigation Report was prepared in response to recommendations provided by The Source Group, Inc. (SGI) in the report titled, Report For Additional Site Investigation, dated September 25, 2008 (Additional Site Investigation Report). SGI prepared this Supplemental Soil Vapor Investigation Report on behalf of AB&I for submittal to the Alameda County Environmental Health Department (ACEH).

2.0 BACKGROUND

2.1 Site Description

The Site is located at 7825 San Leandro Street, east of the intersection with 77th Avenue in a light industrial area of Oakland (Figures 1 and 2). The Site is surrounded by commercial/industrial properties to the north, south, east, and west. Union Pacific Railroad is located immediately adjacent to and west of the Site. Oakland Truck Stop is located immediately adjacent to and east of the Site. Elmhurst Creek is located along the southeast corner of the property (Figure 2). San Leandro Bay is located approximately one mile west of the Site.

2.2 Site History and Operations

AB&I has been operating at its present location since at least 1930. Business activities include the manufacture of cast pipe and fittings. The facility accepts scrap iron and steel, which it stockpiles on-site and uses during manufacturing activities. The Site encompasses an area of approximately 11.8 acres. The Site contains various warehouses, manufacturing and office buildings. The entire Site is covered with buildings and asphalt/concrete pavement. Seven underground storage tanks (USTs) were previously located on the Site. The USTs included one 8,000-gallon UST used for storing unleaded gasoline, one 8,000-gallon UST used for the storage of mineral spirits and later 1,1,1-trichloroethane (1,1,1-TCA), one 550-gallon UST used for storing regular leaded gasoline, one 10,000-gallon UST used for storing diesel, and three 10,000-gallon USTs used for storing gasoline. All UST have been removed from the Site. UST removal activities were initiated in 1982 and completed in the early 1990s.

2.3 Previous Soil Gas Investigations

Two soil gas investigations were conducted in 2007 and 2008. During these investigations, soil gas samples were collected to assess the potential for vapor intrusion into the office building located adjacent to the former 550-gallon gasoline UST Area (Figure 3). During the 2008 investigation, five soil vapor samples were collected at the Site, four of which were collected from underneath a concrete slab located in the open-air portion of the Office Building (Figure 3). Of the four sample locations in the Office Building, two sample locations (SG-13 and SG-14) had no detectable concentrations of any compounds. Samples collected from the remaining two locations in the Office Building had detectable concentrations of tetrachloroethene (PCE), trichloroethene (TCE), vinyl chloride, and m,p-xylene. The concentrations of PCE detected in soil gas sample SG-16A at a depth of 0.5 feet below the concrete slab was above its respective environmental screening level (ESL) under the commercial exposure scenario. Vinyl chloride was identified at the SG-16B location in the sample collected from a depth of 5-feet below ground surface (bgs) and at the SG-12B location, also collected from a depth of 5-feet bgs. Both vinyl chloride concentrations were above the ESL under the commercial exposure scenario. The presence of higher

concentrations of PCE in shallow soil gas samples, along with the presence of daughter products from the breakdown of PCE in deeper soil gas samples, was interpreted by SGI to be the result of isolated surface spills and unrelated to groundwater. Further details can be found in SGI's reports titled, "Site Investigation Report" and "Additional Site Investigation Report" (SGI, 2008a; SGI, 2008b).

Due to the ESL exceedences described above, SGI recommended an additional soil gas survey from points beneath the concrete slab located in the indoor portions of the Office Building (i.e., lunchroom, locker room, training room, and human resource [HR]/safety offices) to confirm that PCE and vinyl chloride exceedences do not pose a threat to indoor air quality.

On November 4, 2008, ACEH issued a letter to AB&I requesting a work plan to conduct an additional soil gas (soil vapor) investigation (ACEH, 2008).

On January 9, 2009, SGI submitted a work plan to ACEH titled, "Supplemental Soil Vapor Investigation Work Plan" (SGI, 2009). The work plan was subsequently approved by ACEH on January 27, 2009 (ACEH, 2009).

3.0 PURPOSE AND OBJECTIVES

The purpose of this indoor air investigation was to assess soil gas conditions beneath the enclosed portions of the Office Building, and assess any potential health effects to indoor workers related to soil gas. Specific objectives were as follows:

- Collect soil gas samples from the lunchroom, locker room, employee training room, and HR/safety offices; and
- Evaluate potential human health risk to indoor workers based on the soil gas results.

4.0 SOIL GAS INVESTIGATION

On March 13, 2009, three soil gas samples were collected in the area of the employee training classroom, locker room, and the lunchroom (Figure 3). The three samples, SG-17, SG-18, and SG-19, were advanced to a total depth of 1.5-feet bgs. A fourth soil gas sample was attempted in the area of the HR/safety offices. However, due to the excessive thickness of the concrete floor (greater than 12-inches), the concrete was unable to be penetrated and a sample was not collected. Soil gas samples were collected to assess the risk associated with previous detections of PCE and vinyl chloride at concentrations above ESLs at locations (open-air portion of the office building) adjacent to the indoor portion of the Office Building.

4.1 Prefield Activities

Prior to initiating fieldwork a soil-boring permit was obtained from the Alameda County Public Works Department.

4.2 Soil Gas Sampling Activities

Soil gas samples were collected in accordance with the requirements of the January 2003 Active Soil Gas Investigation Advisory, published by the DTSC and the California Regional Water Quality Control Board (CRWQCB), Los Angeles Region. Soil gas samples were collected from discrete depths. The initial sample hole was advanced using a rotor hammer drill equipped with a 24-inch long by 1-inch diameter drill bit. Once the borehole was advanced, a soil gas implant attached to polyurethane tubing was set at the bottom of the borehole. Following the placement of the implant, the borehole was filled with sand and sealed at the surface using bentonite grout. Prior to sample collection, one tube volume of air was purged. Soil gas samples were collected through the polyethylene tubing into a syringe, and immediately transferred to the on-site mobile laboratory for analysis. During collection of the soil gas sample, a leak detection gas (1,1 Difluoroethane) in the form of a dust aerosol can was sprayed near the surface of the borehole to check for leaks. The target depth of each soil gas sample was 5-feet bgs. However, all three of the boreholes (SG-17, SG-18, and SG-19) met refusal at a depth of approximately 1.5-feet bgs. Three attempts were made to advance the fourth borehole in the area of the HR/safety offices. However, due to the excessive thickness of the concrete (greater than 12-inches) at each attempted sample location, the drill was unable to penetrate the concrete and no sample was collected.

The sample containers were labeled with a unique sample-point identification and the date and time of collection. Samples were taken to an on-site mobile laboratory operated by TEG Northern California, Inc. (Rancho Cordova, California), logged onto the chain-of-custody form, assigned a laboratory identification number and analyzed for VOCs using EPA Method 8260B.

After removing the sample rod and associated equipment from the ground, the borehole was sealed using cement grout and capped with concrete at the surface.

4.3 Equipment Decontamination

To minimize the potential for cross-contamination, soil gas equipment was decontaminated prior to initiating work at each sample location. The boring rods did not come into contact with the soil gas sample and thus only needed to be brushed clean of soil between sample locations. The drop off point, nylon 1/8-inch tubing, and sampling syringes were all disposable, and new pieces were used for each sample. The threaded point holder was decontaminated by an Aquanox wash and potable water rinse.

5.0 SOIL GAS INVESTIGATION RESULTS

Soil gas samples were analyzed for EPA target list volatiles using EPA Method 8260B. Of the constituents analyzed, only PCE and benzene were detected above laboratory reporting limits. Benzene was detected at a concentration of 0.15 micrograms per liter (µg/L) from soil gas sample SG-18 collected in the area of the locker room. PCE was detected at a concentration of 3.1 µg/L in sample SG-19 collected in the area of the lunchroom. Only PCE exceeded its ESL of 1.4 µg/L for indoor air vapor intrusion concerns under the commercial land-use scenario. The sample collected from the training room (SG-17) did not have concentrations of any compound above laboratory reporting limits. Laboratory results are included as Appendix A.

6.0 SITE-SPECIFIC RISK ASSESSMENT FOR TETRACHLOROETHENE

Based on the results, PCE was the only compound detected in soil gas samples collected from within the indoor air portions of the office building at a concentration above CRWQCB ESLs for the commercial land-use scenario. This site-specific risk assessment was conducted to identify potential adverse noncancer health effects and excess cancer risks associated with PCE in soil gas underlying the interior portion of the Office Building.

CRWQCB ESLs correspond to an excess cancer risk of 1×10^{-6} based on standardized equations (CRWQCB, 2007) that combine exposure assumptions with agency-derived toxicity data. In order to estimate site-specific human health risks, a human health risk evaluation was performed using the Johnson and Ettinger Model, a standard USEPA method, and measured soil gas sampling results for PCE. Excess cancer risks were compared to the USEPA recommended target excess cancer risk range of one-in-one-million (1×10^{-6}) to one-in-ten thousand (1×10^{-4}; USEPA, 1989). The Johnson and Ettiger Model calculated excess cancer risk value based on the detected PCE soil gas concentration of 3.0 µg/L at a depth of 1.5 feet bgs in silty soil was 9×10^{-6} (see Appendix B), which is within the USEPA acceptable risk range.

As quoted from the CRWQCB's ESL (CRWQCB, 2007) document:

> Remediation or risk management is rarely warranted at sites where the estimated cancer risk does not exceed 10^{-6}. Remediation or risk management is almost always warranted at sites where the estimated cancer risk exceeds 10^{-4}. For sites where the estimated risk is between 10^{-4} and 10^{-6}, the need for active remediation or risk management is evaluated on a site-specific basis (i.e., risks within this range are "potentially acceptable", depending on site-specific considerations)

The estimated cancer risk was based on a commercial/industrial worker that spends the entire workday indoors for 250 days a year for 25 years. Based on the known occupants of the lunchroom, the exposure scenario evaluated in this assessment likely overestimates risk (i.e., actual receptors at the Site spend much less time in the lunchroom). Furthermore, in the area where workers might spend the entire workday indoors (i.e. the HR/safety office), the floor is comprised of at least a 12-inch layer of concrete, the surface of which has been painted. Therefore, it is unlikely that any soil gas vapors that may be present beneath the concrete slab will significantly impact indoor air quality under the current exposure scenario.

7.0 CONCLUSIONS AND RECOMMENDATIONS

PCE and benzene continue to be the most prevalent compounds in soil gas in the vicinity of the office building. Based on previous ESL exceedences for benzene and PCE in soil gas samples collected near the office building and in areas located within the open-air portions of the office building, there were concerns about threats to indoor air quality within the office building. Of the three samples collected from within the interior portions of the Office Building, only one had a concentration of PCE above ESLs. Because PCE exceeded its ESL, a site-specific risk assessment was performed to estimate human health risks. Using the data collected, the calculated total excess cancer risk estimate was within the USEPA acceptable risk range. Furthermore, based on the known use of the lunchroom and the construction of the HR/safety office floor, the exposure scenario evaluated in this assessment likely overestimates the risk to workers. Therefore, SGI believes that risks posed by subsurface soil gas concentrations are acceptable and does not recommend any further action.

1.0 INTRODUCTION

On behalf of AB&I Foundry (AB&I), The Source Group. Inc. (SGI) has prepared this Semi-Annual Monitoring and Enhanced Anaerobic Biodegradation (EAB) Pilot Study Report (Report) for the AB&I Foundry Site located at 7825 San Leandro Street in Oakland, Calfornia (Figure 1; Site). This Report details the results of semi-annual monitoring activities conducted in May 2009 and the progress and results of implementing the scope of work outlined in SGI's "Work Plan for Enhanced Anaerobic Biodegradation Pilot Study – Parking Lot Area and Former 8,000-Gallon Mineral Spirits/1,1,1-TCA UST", dated March 12, 2009 (SGI 2009). This Report was prepared for submittal to the Alameda County Environmental Health Department (ACEH).

2.0 BACKGROUND

2.1 Site Description and History

The Site is located at 7825 San Leandro Street, east of the intersection with 77th Avenue, in a light industrial area of Oakland (Figures 1 and 2). The Site is bounded by commercial/industrial properties to the north, south, east, and west. Union Pacific Railroad is located immediately adjacent to and west of the Site. Oakland Truck Stop is located immediately adjacent to and east of the Site. Elmhurst Creek is located along the southeast corner of the property (Figure 2). San Leandro Bay is located approximately one mile west of the Site.

AB&I has been operating at its present location since at least 1930 (BSK Associates [BSK], 1993). Business activities include the manufacture of cast pipe and fittings. The facility accepts scrap iron and steel, which it stockpiles on-site, and uses during manufacturing activities. The Site encompasses an area of approximately 11.8 acres. The Site contains various warehouses, manufacturing and office buildings. The entire Site is covered with buildings and asphalt and concrete pavement. Seven underground storage tanks (USTs) were previously located on the Site. The USTs included one 8,000-gallon UST used for storing unleaded gasoline, one 8,000-gallon UST used for the storage of mineral spirits and later 1,1,1-trichloroethane (1,1,1-TCA), one 550-gallon UST used for storing regular leaded gasoline, one 10,000-gallon UST used for storing diesel, and three 10,000-gallon USTs used for storing gasoline. All UST have been removed from the Site. UST removal activities were initiated in 1982 and completed in the early 1990s.

Following the removal of the seven USTs, various investigations were conducted at the Site to characterize the presence and extent of contaminated soil and groundwater associated with the former USTs. In July 2006, a soil and groundwater assessment was conducted as part of a property transfer. According to BSK, groundwater samples were collected from each of the existing monitoring wells (MW-1, MW-3, and MW-4) and submitted for chemical analysis for polycyclic aromatic hydrocarbons (PAHs) using U.S. Environmental Protection Agency (EPA) Method 8270C, total petroleum hydrocarbons as gasoline (TPHg) and total petroleum hydrocarbons as diesel (TPHd) using EPA Method 8015M as well as benzene, toluene, ethylbenzene, and xylenes (BTEX) using EPA Method 8020. All samples were also analyzed for volatile organic compounds (VOCs) including fuel oxygenates, using EPA Method 8260B. Well MW-2 was found to be damaged beyond repair, and therefore was not sampled. On August 13, 2006 monitoring well MW-2, was abandoned (BSK, 2007).

On August 12, 13, and 18, 2006, six new groundwater monitoring wells (MW-2R, and MW-5 through MW-9) were installed. Between August 17 and August 23, 2006, water levels were measured and groundwater samples were collected from the three existing and six new monitoring wells. One groundwater sample from each of the previously existing wells (MW-1, MW-3, and MW-4) was analyzed

for PAHs. Groundwater samples from the six newly installed wells (MW-2R, MW-5, MW-6, MW-7, MW-8 and MW-9) were submitted for chemical analysis for TPHg TPHd, BTEX, VOCs including fuel oxygenates, and PAHs. In addition, soil samples were collected at various depth intervals during the installation of monitoring wells MW-5, MW-6, MW-7, and MW-8 and were analyzed for metals and VOCs using EPA Methods 6020 and EPA Method 8260B, respectively.

Results of the July/August 2006 sampling event indicated that five of the nine wells had concentrations of at least one compound that exceeded their respective EPA maximum contaminant level (MCL) or California Regional Water Quality Control Board – San Francisco Bay Region (CRWQCB-SF) Environmental Screening Levels (ESLs) for groundwater that is a current or potential source of drinking water (BSK, 2007).

In 2007 and 2008, SGI conducted soil and groundwater investigations on the Site. These investigations included the investigation of both shallow groundwater (less than 30 feet below ground surface [bgs]) and deep groundwater (greater than 30 feet bgs), and the collection of soil vapor samples. The results of these investigations indicated that shallow groundwater in the vicinity of the Parking Lot Area (located in the vicinity and northwest of well MW-8; Figure 3) is impacted with chlorinated VOCs, including 1,1,1-TCA, 1,1-dichloroethane (1,1-DCA), 1,1-dichloroethene (1,1-DCE), chloroethane, cis and trans 1,2-dichloroethene (1,2-DCE), and vinyl chloride. Shallow groundwater in the vicinity of the Former Three 10,000 Gallon USTs Area (located in the vicinity of well MW-9 and downgradient of the three former 10,000 gallon USTs) is impacted with petroleum fuels (TPH) including BTEX, TPHg, and TPHd. Of the compounds detected, only vinyl chloride exceeded its respective ESL for vapor intrusion from groundwater into indoor air under the commercial land use scenario. Results of the soil vapor analysis indicated that two soil gas samples had ESL exceedences for indoor air vapor intrusion for vinyl chloride and tetrachloroethene (PCE) under the commercial land use scenario. In addition, two soil gas samples had ESL exceedences for indoor air vapor intrusion for benzene and ethylbenzene (one location) under the commercial land use scenario. Further details can be found in SGI's reports titled, "Site Investigation Report" and "Additional Site Investigation Report" (SGI 2008a; SGI 2008b).

On November 4, 2008, ACEH submitted a letter to AB&I stating that "the mass of residual fuel hydrocarbons present below the water table constitutes on ongoing source of groundwater contamination" in the area of the former three 10,000-gallon USTs. Therefore, ACEH requested that AB&I "implement cleanup to reduce the mass of residual fuel hydrocarbons in the source area." In addition, ACEH expressed concern regarding the apparent recalcitrance of chlorinated VOCs in groundwater, associated with releases from the former 8,000-gallon mineral spirits/1,1,1-TCA UST, to further breakdown, which could promote the accumulation of vinyl chloride. To address these issues, ACEH requested that AB&I submit work plans to conduct pilot test studies of remediation technologies to remediate chlorinated VOCs associated with releases from the former 8,000-gallon mineral spirits/1,1,1-TCA UST and petroleum hydrocarbons in the area of the former three 10,000-gallon USTs (ACEH 2008).

On March 26, 2009, ACEH approved SGI's work plan titled, "Work Plan for Enhanced Anaerobic Biodegradation Pilot Study – Parking Lot Area and Former 8,000-Gallon Mineral Spirits/1,1,1-TCA UST" with the following comments (ACEH 2009):

- "The proposed short-term cleanup goal for vinyl chloride of 10 micrograms per liter (µg/L), which is based on the vapor intrusion to indoor air pathway, is acceptable."
- For all other chemicals, with the exception of vinyl chloride, ACEH defers comment or approval of the short-term clean-up goals at this time.

2.2 Hydrogeological Setting

The Site is located near the San Francisco Bay within an area identified as the East Bay Plain. The East Bay Plain is situated on the east side of the San Francisco Bay depression. The alluvial sediments of the East Bay Plain consist of a mixture of gravel, sand and clay deposited by coalescing alluvial fans. In the vicinity of the Site, fluvial and near shore deposits have been mapped (Helley et. al., 1979). The fluvial deposits are described as unconsolidated, moderately sorted, fine sand and silt, with clayey silt and occasional thin beds of coarse sand (Muir, 1993). The near-shore deposits are described as a well-sorted, fine to medium grained sand and silt, with lenses of sandy clay and clay. Regional groundwater flow in the vicinity of the Site is interpreted to be towards the west - southwest toward San Leandro Bay.

The Site is underlain by a mixture of sandy/silty clay to a depth of at least 20-feet below ground surface (bgs). Groundwater has been encountered in borings and excavations at depths ranging from 8 to 12-feet bgs at the Site. Based on groundwater monitoring data from on-site monitoring wells for the December 2008 sampling event, groundwater flows to the northwest at a gradient of 0.006 feet per foot (ft/ft; SGI 2009).

Based on the Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan) (RWQCB, 1995), groundwater beneath the site is part of the East Bay Plain basin, which has beneficial uses for municipal and domestic drinking water supply, industrial process and service water supply, and agricultural water supply. That said, East Bay Municipal Utility District (EBMUD) provides water for these uses to the site and vicinity from Sierra-fed surface-water sources. Development of the shallow water-bearing zones beneath the site for beneficial uses is remote due to uneconomically low, sustainable well yields, and the presence of regional contamination (e.g., coliform from leaking sanitary sewer lines, unrelated chemical plumes), and presence of more productive water-bearing zones at depth (RWQCB, 1999). In addition, State regulations require sealing of at least the upper 50 feet of subsurface for public/industrial water supply wells (Department of Water Resources, 1991).

3.0 SEMI-ANNUAL MONITORING ACTIVITIES

Sampling of all nine wells (MW-1, MW-2R, and MW-3 through MW-9) was conducted on May 21, and May 22, 2009 as part of the May 2009 semi-annual monitoring event and for the purpose of collecting baseline concentrations from select wells in preparation for EAB injection activities. Monitoring activities included water level gauging and groundwater sampling.

3.1 Monitoring Well Inspection and Gauging

Upon arrival at the Site, all nine wells (MW-1, MW-2R, and MW-3 through MW-9) were located, inspected, and judged to be secure and in good condition. The wells were then gauged for depth to water and total well depth using an electronic water level meter. The water level meter was properly decontaminated between successive wells. Well gauging data are provided in Table 1.

3.2 Groundwater Sampling

Prior to sampling, the wells were purged using low-flow (i.e., low stress) procedures. Purging and sampling was performed using a peristaltic pump with dedicated tubing. Flow rates were generally maintained in the range of 100-200 milliliters per minute. During purging, water quality parameters including pH, temperature, electric conductivity (EC), oxidation-reduction potential (ORP), and dissolved oxygen (DO) were monitored to ensure that groundwater representative of the aquifer was entering the well. Convergence of these parameters on successive measurements was used as an indicator that the wells had been adequately purged. Copies of the Monitoring Well Purging/Sampling Field Forms are included in Appendix A.

All nine wells were sampled during the May 2009 semi-annual monitoring event. Groundwater samples were collected in laboratory-supplied containers, appropriate for the specified analysis. All containers were capped, labeled, placed on ice, and transported under chain-of-custody to Advanced Technology Laboratories (ATL), located in Signal Hill, California, for analysis of VOCs using EPA Method 8260B and TPHg and TPHd using EPA Method 8015M. In addition, samples collected from wells MW-2R, MW-3, MW-5, MW-6, and MW-8 were analyzed for total organic carbon (TOC) using method SM5310B and methane, ethane, and ethene using method RSK-175. A field duplicate sample was collected from MW-8. An equipment blank and trip blank, analyzed for VOCs as a quality control measure, were also submitted to ATL. A copy of the laboratory analytical report is included as Appendix B.

3.3 Decontamination and Disposal Procedures

All non-dedicated or non-disposable sampling equipment was decontaminated using a triple-rinse method consisting of successive rinses of Alconox soap and de-ionized water. Rinsate and purge water were staged on-site in properly labeled Department of Transportation approved 55-gallon drums pending waste characterization and appropriate disposal.

3.4 May 2009 Semi-Annual Monitoring Results

3.4.1 Groundwater Flow

Groundwater elevation measurements were calculated by measuring the depth to water in the wells relative to the top of the well casing then subtracting the depth to water from the elevation of the well. Groundwater elevations in wells during the May 2009 semi-annual monitoring event ranged from 0.60 feet above mean sea level (msl) in well MW-6 to 2.39 feet above msl in well MW-7 (Table 1). As shown on Figure 3, estimated groundwater flow direction during the semi-annual monitoring event was generally to the north/northwest at a hydraulic gradient of approximately 0.0019 feet/foot. The groundwater flow direction and gradient are generally consistent with past monitoring events. On average, groundwater elevations in all wells have increased by a foot or more relative to the monitoring event conducted in December 2008.

3.4.2 Groundwater Analytical Results

Concentrations of chlorinated VOCs and TPH detected during the May 2009 semi-annual monitoring event were generally within historic ranges. Wells MW-8 and MW-9 continue to contain the highest concentrations of chlorinated VOCs and TPH, respectively. Wells MW-4, MW-6, and MW-7 did not have concentrations of any compound above laboratory practical quantitation limits (PQLs). A summary of analytical results is included in Table 2. A summary of historical concentrations is included as Appendix C.

4.0 ENHANCED ANAEROBIC BIODEGRADATION ACTIVITIES

Following the collection of baseline samples during the May 2009 semi-annual monitoring event, injection activities were commenced in June 2009 as part of the EAB pilot study. The primary purpose of the pilot study was to evaluate the ability to reduce the concentration of chlorinated VOCs (i.e., 1,1,1-TCA, 1,1-DCA, 1,1-DCE, cis and trans 1,2-DCE, vinyl chloride, and chloroethane) in the Parking Lot Area through EAB. EAB was promoted through the in-situ addition of an emulsified oil substrate (EOS®), a carbon-donating substance.

4.1 Prefield Activities

Prior to field activities, a soil-boring permit was obtained from Alameda County Public Works Department. In addition, underground service alert (USA) was notified at least 48 hours prior to the commencement of field activities.

4.2 EAB Field Activities

On June 4, 2009, (prior to EAB injection activities), a grab groundwater sample (SB-52-GW20) was collected approximately 40 feet southeast of well MW-8 (Figure 3) to evaluate groundwater conditions in the proposed area of upgradient EAB injection locations. The sample was collected between 16 to 20 feet below ground surface (bgs) using a hydropunch sampler. One groundwater sample was collected and submitted to Test America Laboratories (TAL), located in Pleasanton, California and analyzed for VOCs using EPA Method 8260B. Results from the analysis indicated that no chlorinated VOCs were detected at concentrations equal to, or above, laboratory PQLs (Table 3). Based on these results, final EAB injection locations were revised as shown on Figure 4 and described below.

On June 4, 5, 8, and 9, 2009, 15 injections (PL-1 through PL-15) were advanced in the Parking Lot Area. Of the 15 injections, 10 were advanced in the area upgradient of MW-8 on 10-foot centers, and five were advanced in the area upgradient of MW-3 on 15-foot centers (Figure 4). Vironex, Inc., a licensed drilling contractor, was contracted to perform the injections. Each point consisted of a two-inch diameter stainless steel casing driven into the subsurface via a direct-push-type rig operated by qualified and experienced personnel. Hollow sections of steel casing were added and advanced until the designed injection depth(s) were reached. The injections were conducted using a 'bottom-up' injection approach starting at a depth of 20 feet bgs and ending at a depth of five feet bgs. After the hollow steel rods were driven to the desired injection depth, the points were connected to the EOS® pumping and injection equipment. Flow rates for the injections were maintained between 2 to 7 gallons per minute (gpm) at pressure that did not exceed 50 pounds per square inch (psi). Injections were conducted at a rate of approximately 24.3 gallons per foot for a total of 365 gallons of EOS® mixture injected into each location.

Each EOS® mixture batch consisted of 55-gallons (one drum) of EOS® and 310-gallons of water. Field injection forms are included as Appendix D.

4.3 Equipment Decontamination

Soil sampling equipment, such as small tools and disposable gloves, were decontaminated or disposed of after each use. The decontamination procedure consisted of:

- Wash in a phosphate-free soap and water mixture;
- Rinse thoroughly in distilled water following washing, and
- Final rinse using distilled water.

Decontamination of larger drilling equipment was conducted using a steam cleaner supplied by subcontractor selected for injection work.

4.4 Waste Management

Soil cuttings and decon water generated during the injection activities was stored on Site in properly labeled containers pending proper disposal.

4.5 Effectiveness Monitoring

To monitor the effectiveness of the EAB injection activities, groundwater samples were collected to assess reduction of chlorinated VOC concentrations and changes in other natural attenuation indicator parameters (e.g., TOC, methane, ethane, and ethene). Prior to the injection event, baseline samples were collected from wells MW-2R, MW-3, MW-5, MW-6, and MW-8 as part of the May 2009 semi-annual monitoring event. Following the injection event, post-injection samples were collected from wells MW-3 and MW-8 on July 1, August 7, and September 10, 2009. Baseline and post-injection groundwater samples were analyzed for the following:

- Chlorinated VOCs using EPA Method 8260B,
- TOC using EPA Method 415.1, and
- Methane, ethane, and ethene concentrations using method RSK-175.

In addition, field measurements were taken for DO, water temperature, pH, EC, and ORP. Groundwater monitoring wells were sampled in accordance with the procedures and methodologies outlined in SGI's work plan titled, "Revised Site Investigation Work Plan", dated September 17, 2007 (SGI 2007).

4.6 EAB Monitoring Results

Wells MW-3 and MW-8 were sampled to monitor the effectiveness of EAB injection activities. Both wells are located directly downgradient of EAB injection locations, and therefore were most reflective of groundwater conditions. Results for each sampling event are discussed below. Copies of the laboratory analytical reports are included as Appendix B and summarized in Table 3.

4.6.1 Pre-Injection Baseline Sample Results – May 21, 2009

MW-3

Concentrations of chlorinated VOCs detected during the May 2009 sampling event were generally within historic ranges with the exception of 1,1-DCE. Concentrations of 1,1-DCE decreased from a concentration of 2,000 µg/L detected during the December 2008 sampling event, to 1,000 µg/L (May 2009). 1,1-DCE continues to be the highest compound detected, followed by 1,1-DCA (220 µg/L), cis-1,2-DCE (10 µg/L), vinyl chloride (8.4 µg/L), and trans-1,2-DCE (1.2 µg/L).

Methane and ethane were detected at concentrations of 300 and 16 µg/L, respectively. Ethene was not detected at or above the laboratory practical quantitation limit (PQL) of 3 µg/L. TOC was detected at a concentration of 7.4 milligrams per liter (mg/L).

MW-8

Concentrations of chlorinated VOCs detected during the May 2009 sampling event were generally within historic ranges and continue to be the highest concentration of chlorinated VOCs at the site. 1,1,1-TCA and 1,1-DCE were detected at the highest concentrations, both at a concentration of 1,900 µg/L. Other chlorinated VOCs detected include 1,1-DCA (1,500 µg/L), chloroethane (320 µg/), and vinyl chloride (16 µg/L).

Methane, ethane, and ethene were detected at concentrations of 1,100, 19, and 9.6 µg/L, respectively. TOC was not detected at or above the laboratory PQL of 3 mg/L.

4.6.2 Post-Injection Sample Results – July 1, 2009

MW-3

Concentrations of chlorinated VOCs detected during the July 2009 sampling event were generally similar to concentrations detected during the May 2009 sampling event with the exception of 1,1-DCA and 1,1-DCE. Concentrations of 1,1-DCA decreased from 220 µg/L (May 2009) to 160 µg/L. Concentrations of 1,1-DCE decreased from 1,000 µg/L (May 2009) to 620 µg/L (July 2009).

Methane concentrations increased slightly from 300 to 450 µg/L and ethane concentrations decreased from 19 to 16 µg/L. Ethene was not detected at or above laboratory PQLs. TOC concentrations increased from 7.4 to 320 mg/L.

MW-8

Chlorinated VOC concentrations decreased slightly for all detected compounds from the May 2009 sampling event with the exception of chloroethane. Chloroethane concentrations increased from 320 µg/L (May 2009) to 350 µg/L.

Methane, ethane, and ethene concentrations remained fairly similar to concentrations detected during the May 2009 sampling event with slight decreases in methane concentrations (1,100 to 1,400 µg/L). TOC concentrations increased from PQLs to 260 mg/L.

4.6.3 Post-Injection Sample Results – August 7, 2009

MW-3

Reductions in all chlorinated VOCs, with the exception of chloroethane and vinyl chloride, were observed during the August 2009 sampling event. Concentrations of 1,1-DCA, 1,1-DCE, and cis-1,2-DCE decreased from 160, 620, and 7.5 µg/L, respectively (July 2009) to 110, 94, and 1.2 µg/L, respectively. Chloroethane and vinyl chloride concentrations increased from less than PQLs and 6.7 µg/L, respectively (July 2009) to 61 and 29 µg/L, respectively.

Methane and ethane concentrations decreased during this sampling event to 63 and 2.7 µg/L, respectively. Ethene concentrations increased to 16 µg/L. TOC concentrations decreased from 320 mg/L to 260 mg/L.

MW-8

Overall concentrations of chlorinated VOCs increased slightly compared to concentrations reported during the July 2009 sampling event with the exception of vinyl chloride. Concentrations of chloroethane, 1,1-DCA, 1,1-DCE, and 1,1,1-TCA increased slightly while vinyl chloride concentrations decreased.

Methane and ethane concentrations decreased to 460 and 5.9 µg/L, respectively, and ethene concentrations decreased to below PQLs. TOC concentrations decreased from 260 (July 2009) to 200 mg/L.

4.6.4 Post-Injection Sample Results – September 10, 2009

MW-3

Concentrations of all chlorinated VOCs decreased during the September 2009 sampling event with the exception of chloroethane. 1,1-DCA, 1,1-DCE, cis-1,2-DCE, and vinyl chloride concentrations decreased from 110, 94, 7.5, and 29 µg/L, respectively (August 2009) to 5.6, 11, 0.20, and 3.6 µg/L, respectively. Chloroethane concentrations increased from 61 µg/L (August 2009) to 150 µg/L.

Methane concentrations increased sharply compared to concentrations detected during the August 2009 sampling event, while ethane and ethene concentrations remained fairly similar to previous sampling events. Methane concentrations increased from 63 µg/L to 6,000 µg/L. Ethane and ethene concentrations increased from 2.7 and 16 µg/L, respectively (August 2009) to 4.1 and 41 µg/L, respectively. TOC concentrations decreased from 260 mg/L (August 2009) to 170 mg/L.

MW-8

Concentrations of all chlorinated VOC decreased during the September 2009 sampling event with the exception of vinyl chloride and 1,1-DCA. 1,1,1-TCA, 1,1-DCE, and chloroethane concentrations decreased from 1,700, 1,300, and 370 µg/L, respectively (August 2009) to 45, 1,100, and 340 µg/L, respectively. Vinyl chloride and 1,1-DCA concentrations increased from 9.6 and 1,600 µg/L, respectively (August 2009) to 50 and 2,600 µg/L, respectively.

Methane, ethane, and ethene concentrations remain fairly similar to concentrations detected during the August 2009 sampling event. TOC concentrations decreased from 200 mg/L (August 2009) to 160 µg/L.

5.0 EVALUATION OF PILOT STUDY TEST

The performance objectives for the EAB program were as follows:

- Ensure that EAB is compatible with site-specific conditions.
- Evaluate effectiveness of EAB injections.
- Evaluate longevity of EAB Injections.

Ensure that EAB is Compatible with Site-Specific Conditions

This objective seeks to ensure the sufficient quantities of EOS® could be injected based on site lithology. During injection activities, approximately 365-gallons of EOS® mixture were injected into each of the 15 locations. EOS® was delivered at a flow rate that varied from 2 to 7 gpm with an approximate distribution of 24.3 gallons per foot over a 15-foot interval per location. Injection pressures never exceeded 50 pounds per square inch (psi) and were averaging 25 to 30 psi throughout the injection event. Generally, injection pressures were the highest during deep injections (greater than 15 feet bgs) and dropped as the injection neared the surface. No "daylighting" of EOS® was observed at any of the locations and the target volume (365-gallons) of EOS® mixture was delivered at each injection location. Overall, no significant problems were encountered indicating that injection activities were compatible with site conditions.

Evaluate Effectiveness of EAB injections

Carbon-donating substances are typically food-grade vegetable oils and work by acting as a food source to promote microbial activity and growth. In the subsurface, the oil slowly degrades and provides a long-term source of dissolved organic carbon for microbial cell growth. As the carbon source is consumed, molecular hydrogen is produced, which serves as an electron donor for reductive dechlorination of chlorinated VOCs. Under anaerobic (oxygen deficient) conditions, the organic contaminants will be ultimately metabolized to ethane, ethene, limited amounts of carbon dioxide, and trace amounts of hydrogen. Illustrations of the pathways are included below.

1,1,1-TCA → 1,1-DCA → Chloroethane → Ethane/Methane

1,1,1-TCA → 1,1-DCE → Vinyl Chloride → Ethene

To evaluate the effectiveness of EAB activities, concentrations of chlorinated VOCs were monitored for a decrease in parent product concentrations (1,1,1-TCA) along with a subsequent increase in the daughter product concentrations (1,1-DCA, 1,1-DCE, vinyl chloride). In order to determine whether the pathway is moving towards completion, an increase in methane, ethane, or ethene is expected.

MW-3

Data collected during the four-month monitoring program indicates that EAB is effective and is actively reducing concentrations of chlorinated VOCs in groundwater in the area of well MW-3. Concentrations of 1,1-DCA, 1,1-DCE, and vinyl chloride in well MW-3 have been reduced from highs of 220, 2,000, and 29 µg/L (Appendix C), respectively to 5.6, 11, and 3.6 µg/L, respectively. Furthermore, methane concentrations have increased from 300 µg/L (May 2009) to 6,000 µg/L (September 2009) indicating that the reductive dechlorination pathway is moving towards completion. A graph illustrating chlorinated VOC and methane concentrations for well MW-3 is included as Figure 5.

MW-8

Data collected during the four-month monitoring program indicates that EAB is effective and is actively reducing concentrations of chlorinated VOCs in groundwater in the area of well MW-8. Concentrations of the primary contaminant (1,1,1-TCA) have been reduced from 1,900 µg/L (May 2009) to 45 µg/L (September 2009). As a result of the breakdown of 1,1,1-TCA, the concentrations of daughter products (1,1-DCA and vinyl chloride) have increased (Table 3). Geochemical data collected during the September 2009 sampling event suggest that reductive dechlorination is occurring. During the September 2009 sampling event, DO concentrations were strongly anaerobic (less than 2 mg/L) and the ORP was negative indicating that anaerobic and reductive conditions were present. In addition, TOC concentrations were elevated (greater than 100 mg/L). All three factors suggest that conditions are favorable for the continued breakdown of chlorinated VOCs via reductive dechlorination, and it is expected that elevated concentrations of 1,1-DCA and vinyl chloride will decrease over time, similar to what was observed in well MW-3. A graph illustrating chlorinated VOC and methane concentrations for well MW-8 is included as Figure 6.

Evaluate Longevity of EAB Injections

This objective seeks to ensure that EOS® has sufficient longevity to treat the required contamination within the target area. Baseline concentrations of TOC ranged from less than laboratory PQLs (wells MW-2R, MW-5, and MW-8) to 7.4 mg/L (well MW-3). Following the injection of EOS®, TOC concentrations increased to 320 and 260 mg/L in wells MW-3 and MW-8, respectively. Three months after the injection event, TOC concentrations remain greater than 150 mg/L. Additional TOC analyses will be performed during the December 2009 sampling event for wells MW-3 and MW-8 to determine if adequate carbon remains within the system.

6.0 CONCLUSIONS

Semi-annual monitoring conducted in May 2009 indicates that concentrations of chlorinated VOCs and TPH at the Site were similar to historical concentrations. In June 2009, an EAB pilot study was conducted in the Parking Lot Area to promote the breakdown of chlorinated VOCs via reductive dechlorination through addition of the carbon-donating substance, EOS®. The pilot study included the injection of an EOS® mixture into a total of 15 locations. Ten points were located upgradient of well MW-8 and five points were located upgradient of MW-3. Groundwater was then monitored from each well on a monthly basis for three months to evaluate the effectiveness of EAB activities. Following the three months of monitoring, data indicates that the EAB injection activities were successful in reducing chlorinated VOC concentrations. Chlorinated VOC concentrations in well MW-3 have decreased to concentrations that are below the approved short-term cleanup goals. In well MW-8, the concentration of 1,1,1-TCA was reduced to 45 µg/L, which resulted in an increase of 1,1-DCA and vinyl chloride concentrations. However, TOC concentrations and geochemical parameters indicate that conditions are favorable for the continued reduction of chlorinated VOCs in the vicinity of MW-8, similar to what was observed in well MW-3. Therefore, it is expected that concentrations of both 1,1-DCA and vinyl chloride will decrease over time.

EAB activities in the Parking Lot Area have been effective in reducing chlorinated VOC in groundwater in the vicinity of wells MW-3 and MW-8, both of which have had the highest concentrations of chlorinated VOCs on the Site. Groundwater conditions in the vicinity of both wells suggest that reductive dechlorination is continuing to occur.

The next groundwater sampling event scheduled for December 2009 will assist in confirming that reductive dechlorination is continuing to occur. A final evaluation of EAB effectiveness will be presented following the December 2009 sampling event.

The Source Group, Inc.

1.0 INTRODUCTION

On behalf of AB&I Foundry (AB&I), The Source Group. Inc. (SGI) has prepared this Enhanced Aerobic Biodegradation (EAB) Pilot Study Report (Report) for the AB&I Foundry Site located at 7825 San Leandro Street in Oakland, Calfornia (Figure 1; Site). This Report details the progress and results of implementing the scope of work outlined in SGI's "Work Plan for Enhanced Aerobic Biodegradation Pilot Study – Former Three 10,000-Gallon USTs Area", dated March 12, 2009 (SGI 2009). This Report was prepared for submittal to the Alameda County Environmental Health Department (ACEH).

2.0 BACKGROUND

2.1 Site Description and History

The Site is located at 7825 San Leandro Street, east of the intersection with 77th Avenue, in a light industrial area of Oakland (Figures 1 and 2). The Site is bounded by commercial/industrial properties to the north, south, east, and west. Union Pacific Railroad is located immediately adjacent to and west of the Site. Oakland Truck Stop is located immediately adjacent to and east of the Site. Elmhurst Creek is located along the southeast corner of the property (Figure 2). San Leandro Bay is located approximately one mile west of the Site.

AB&I has been operating at its present location since at least 1930 (BSK Associates [BSK], 1993). Business activities include the manufacture of cast pipe and fittings. The facility accepts scrap iron and steel, which it stockpiles on-site, and uses during manufacturing activities. The Site encompasses an area of approximately 11.8 acres. The Site contains various warehouses, manufacturing and office buildings. The entire Site is covered with buildings and asphalt and concrete pavement. Seven underground storage tanks (USTs) were previously located on the Site. The USTs included one 8,000-gallon UST used for storing unleaded gasoline, one 8,000-gallon UST used for the storage of mineral spirits and later 1,1,1-trichloroethane (1,1,1-TCA), one 550-gallon UST used for storing regular leaded gasoline, one 10,000-gallon UST used for storing diesel, and three 10,000-gallon USTs used for storing gasoline. All UST have been removed from the Site. UST removal activities were initiated in 1982 and completed in the early 1990s.

Following the removal of the seven USTs, various investigations were conducted at the Site to characterize the presence and extent of contaminated soil and groundwater associated with the former USTs. In July 2006, a soil and groundwater assessment was conducted as part of a property transfer. According to BSK, groundwater samples were collected from each of the existing monitoring wells (MW-1, MW-3, and MW-4) and submitted for chemical analysis for polycyclic aromatic hydrocarbons (PAHs) using U.S. Environmental Protection Agency (EPA) Method 8270C, total petroleum hydrocarbons as gasoline (TPHg) and total petroleum hydrocarbons as diesel (TPHd) using EPA Method 8015M as well as benzene, toluene, ethylbenzene, and xylenes (BTEX) using EPA Method 8020. All samples were also analyzed for volatile organic compounds (VOCs) including fuel oxygenates, using EPA Method 8260B. Well MW-2 was found to be damaged beyond repair, and therefore was not sampled. On August 13, 2006 monitoring well MW-2, was abandoned (BSK, 2007).

On August 12, 13, and 18, 2006, six new groundwater monitoring wells (MW-2R, and MW-5 through MW-9) were installed. Between August 17 and August 23, 2006, water levels were measured and groundwater samples were collected from the three existing and six new monitoring wells. One groundwater sample from each of the previously existing wells (MW-1, MW-3, and MW-4) was analyzed for PAHs. Groundwater samples from the six newly installed wells (MW-2R, MW-5, MW-6, MW-7, MW-8 and MW-9) were submitted for chemical analysis for TPHg TPHd, BTEX, VOCs including fuel

oxygenates, and PAHs. In addition, soil samples were collected at various depth intervals during the installation of monitoring wells MW-5, MW-6, MW-7, and MW-8 and were analyzed for metals and VOCs using EPA Methods 6020 and EPA Method 8260B, respectively.

Results of the July/August 2006 sampling event indicated that five of the nine wells had concentrations of at least one compound that exceeded their respective EPA maximum contaminant level (MCL) or California Regional Water Quality Control Board – San Francisco Bay Region (CRWQCB-SF) Environmental Screening Levels (ESLs) for groundwater that is a current or potential source of drinking water (BSK, 2007).

In 2007 and 2008, SGI conducted soil and groundwater investigations on the Site. These investigations included the investigation of both shallow groundwater (less than 30 feet below ground surface [bgs]) and deep groundwater (greater than 30 feet bgs), and the collection of soil vapor samples. The results of these investigations indicated that shallow groundwater in the vicinity of the Parking Lot Area (located in the vicinity and northwest of well MW-8; Figure 3) is impacted with chlorinated VOCs, including 1,1,1-TCA, 1,1-dichloroethane (1,1-DCA), 1,1-dichloroethene (1,1-DCE), chloroethane, cis and trans 1,2-dichloroethene (1,2-DCE), and vinyl chloride. Shallow groundwater in the vicinity of the Former Three 10,000 Gallon USTs Area (located in the vicinity of well MW-9 and downgradient of the three former 10,000 gallon USTs) is impacted with petroleum fuels (TPH) including BTEX, TPHg, and TPHd. Of the compounds detected, only vinyl chloride exceeded its respective ESL for vapor intrusion from groundwater into indoor air under the commercial land use scenario. Results of the soil vapor analysis indicated that two of soil gas samples had ESL exceedences for indoor air vapor intrusion for vinyl chloride and PCE under the commercial land use scenario. In addition, two soil gas samples had ESL exceedences for indoor air vapor intrusion for benzene and ethylbenzene (one location) under the commercial land use scenario. Further details can be found in SGI's reports titled, "Site Investigation Report" and "Additional Site Investigation Report" (SGI 2008a; SGI 2008b).

On November 4, 2008, ACEH submitted a letter to AB&I stating that "the mass of residual fuel hydrocarbons present below the water table constitutes on ongoing source of groundwater contamination" in the area of the former three 10,000-gallon USTs. Therefore, ACEH requested that AB&I "implement cleanup to reduce the mass of residual fuel hydrocarbons in the source area." In addition, ACEH expressed concern regarding the apparent recalcitrance of chlorinated VOCs in groundwater, associated with releases from the former 8,000-gallon mineral spirits/1,1,1-TCA UST, to further breakdown, which could promote the accumulation of vinyl chloride. To address these issues, ACEH requested that AB&I submit work plans to conduct pilot test studies of remediation technologies to remediate chlorinated VOCs associated with releases from the former 8,000-gallon mineral spirits/1,1,1-TCA UST and petroleum hydrocarbons in the area of the former three 10,000-gallon USTs (ACEH 2008).

On March 26, 2009, ACEH approved SGI's work plan titled, "Work Plan for Enhanced Aerobic Biodegradation Pilot Study – Former Three 10,000-Gallon USTs Area" with the following comments (ACEH 2009):

- "The proposed groundwater monitoring in generally acceptable. However, it should be noted that evaluation of the effectiveness of the enhanced aerobic biodegradation pilot study depends almost exclusively upon results from well MW-9. Depending on the initial results of the pilot study, additional monitoring may be necessary to evaluate the effectiveness of the proposed remedial method" (ACEH 2009).

2.2 Hydrogeological Setting

The Site is located near the San Francisco Bay within an area identified as the East Bay Plain. The East Bay Plain is situated on the east side of the San Francisco Bay depression. The alluvial sediments of the East Bay Plain consist of a mixture of gravel, sand and clay deposited by coalescing alluvial fans. In the vicinity of the Site, fluvial and near shore deposits have been mapped (Helley et. al., 1979). The fluvial deposits are described as unconsolidated, moderately sorted, fine sand and silt, with clayey silt and occasional thin beds of coarse sand (Muir, 1993). The near-shore deposits are described as a well-sorted, fine to medium grained sand and silt, with lenses of sandy clay and clay. Regional groundwater flow in the vicinity of the Site is interpreted to be towards the west - southwest toward San Leandro Bay.

The Site is underlain by a mixture of sandy/silty clay to a depth of at least 20-feet below ground surface (bgs). Groundwater has been encountered in borings and excavations at depths ranging from 8 to 12-feet bgs at the Site. Based on groundwater monitoring data from on-site monitoring wells for the December 2008 sampling event, groundwater flows to the northwest at a gradient of 0.006 feet per foot (ft/ft; SGI 2009).

Based on the Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan) (RWQCB, 1995), groundwater beneath the Site is part of the East Bay Plain basin, which has beneficial uses for municipal and domestic drinking water supply, industrial process and service water supply, and agricultural water supply. That said, East Bay Municipal Utility District (EBMUD) provides water for these uses to the Site and vicinity from Sierra-fed surface-water sources. Development of the shallow water-bearing zones beneath the Site for beneficial uses is remote due to uneconomically low, sustainable well yields, and the presence of regional contamination (e.g., coliform from leaking sanitary sewer lines, unrelated chemical plumes), and presence of more productive water-bearing zones at depth (RWQCB, 1999). In addition, State regulations require sealing of at least the upper 50 feet of subsurface for public/industrial water supply wells (Department of Water Resources, 1991).

3.0 ENHANCED AEROBIC BIODEGRADATION ACTIVITIES

The primary purpose of the pilot study was to evaluate the ability to reduce the mass of petroleum hydrocarbons in the Former Three 10,000-Gallon USTs Area through the use of EAB. EAB was promoted through the in-situ addition of Oxygen Releasing Compound (ORC) and Regenox solution (ORC/Regenox), both of which were manufactured by Regenesis. The location and application volume of each injection was based on the nature and extent of petroleum-impacted groundwater at the Site as identified during previous sampling events and are discussed below.

3.1 Prefield Activities

Prior to field activities a soil-boring permit was obtained from Alameda County Public Works Department and underground service alert (USA) was notified at least 48 hours prior to the commencement of field activities.

3.2 EAB Field Activities

On June 10 through June 12, 2009, nine injections (WH-1 through WH-9) were advanced in the warehouse located adjacent to the Former Three 10,000-Gallon USTs Area (Figure 3). Vironex, Inc., a licensed drilling contractor, was contracted to perform the injections. Each point consisted of a two-inch diameter stainless steel casing driven into the subsurface via a direct-push-type rig. Hollow sections of steel casing were then added and advanced until the designed injection depth(s) were reached. Injections were conducted using a 'bottom-up' injection approach starting at a depth of 20 feet and ending at a depth of five feet, or until "daylighting" of ORC/Regenox was observed. After the hollow steel rods were driven to the desired injection depth, the points were connected to the ORC/Regenox pumping and injection equipment. ORC and Regenox were initially mixed in 200 gallons batches at a ratio of approximately one pound of ORC per eight pounds of Regenox. Following injection difficulties described below, the ratio of ORC to Regenox was increased to one pound of ORC per four pounds of Regenox. The final mixture was then diluted with water at a ratio between 6 to 9 percent (%) by weight. Upon completion of the injection event, the points were removed.

During field activities, difficulties with the injections were encountered such as "daylighting", low flow rates, and high injection pressures. The volume of ORC/Regenox solution injected into each location varied depending on site conditions from a high of 640 gallons injected into WH-1 to a low of 53 gallons injected into WH-9. During the injections, injections pressures fluctuated from 10 to 60 pounds per square inch (psi) with an average pressure of around 35 psi at an average flow rate of approximately 3 gallons per minute (gpm). Field injection forms are included as Appendix A.

3.3 Effectiveness Monitoring

The effectiveness of the treatment was monitored by analyzing groundwater samples for reductions in TPH and VOCs concentrations in well MW-9. Prior to the injection event, baseline samples were collected from well MW-9 on May 21, 2009 as part of the May 2009 semi-annual monitoring event. Following the injection event, post-injection samples were collected from well MW-9 on July 1, August 7, and September 10, 2009. Baseline and post-injection groundwater samples were analyzed for the following:

- TPHg and TPHd using EPA Method 8015M; and
- VOCs using EPA Method 8260B.

In addition, field measurements were taken for dissolved oxygen (DO), water temperature, pH, electric conductivity (EC), and oxidation-reduction potential (ORP). Groundwater monitoring wells were sampled in accordance with the procedures and methodologies outlined in SGI's work plan titled, "Revised Site Investigation Work Plan", dated September 17, 2007 (SGI 2007). Field sample logs are included as Appendix B.

3.4 Equipment Decontamination

Soil sampling equipment, such as small tools and disposable gloves, were decontaminated or disposed of after each use. The decontamination procedure consisted of:

- Wash in a phosphate-free soap and water mixture;
- Rinse thoroughly in distilled water following washing; and
- Final rinse using distilled water.

Decontamination of larger drilling equipment will be conducted using a steam cleaner supplied by subcontractor selected for injection work.

3.5 Waste Management

Soil cuttings and decon water generated during the injection activities were stored on Site in properly labeled containers pending proper disposal.

3.6 EAB Monitoring Results

Well MW-9 was sampled to monitor the effectiveness of EAB injection activities. Well MW-9 is located downgradient of EAB injection locations, and therefore, is most reflective of groundwater conditions. Results for each sampling event are discussed below. Copies of the laboratory analytical reports are included as Appendix C and summarized in Table 1.

3.6.1 Pre-Injection Baseline Sample Results – May 21, 2009

TPHg, TPHd, and BTEX concentrations were similar to historical results. TPHg and TPHd were detected at concentrations of 3,500 and 250 micrograms per liter (ug/L), respectively. Benzene, toluene, ethylbenzene, and xylene were detected at concentrations of 180, 2.9, 3.9, and 1.7 ug/L, respectively.

3.6.2 Post-Injection Sample Results – July 1, 2009

TPH concentrations were generally similar to May 2009 concentrations with the exception of benzene. Benzene concentrations decreased from 180 ug/L (May 2009) to 53 ug/L.

3.6.3 Post-Injection Sample Results – August 7, 2009

TPH concentrations were generally similar to July 2009 concentrations with the exception of TPHg, benzene, and toluene. TPHg concentrations decreased from 3,400 ug/L (July 2009) to 2,400 ug/L. Benzene concentrations decreased from 53 ug/L (July 2009) to 9.1 ug/L, and toluene concentrations decreased from 2 ug/L (July 2009) to 0.5 ug/L.

3.6.4 Post-Injection Sample Results – September 10, 2009

TPH concentrations were generally similar to August 2009 concentrations with the exception of TPHg, benzene, and toluene. TPHg concentrations increased from 2,400 ug/L (August 2009) to 3,100 ug/L. Benzene concentrations decreased from 9.1 ug/L (August 2009) to 5.7 ug/L, and toluene concentrations increased from 0.5 ug/L (August 2009) to 0.63 ug/L.

4.0 EVALUATION OF PILOT STUDY TEST

The performance objectives for the EAB program were as follows:

- Ensure that EAB is compatible with site-specific conditions.
- Evaluate effectiveness of EAB injections.
- Evaluate longevity of EAB Injections.

Evaluate that EAB is Compatible with Site-Specific Conditions

This objective seeks to evaluate if sufficient quantities of ORC/Rengenox were injected based on site lithology. As mentioned in section 3.0, problems with injecting in the warehouse were encountered. A total of 8,000 pounds of ORC/Regenox was scheduled to be injected into a total of 15 injection locations based on groundwater contaminant concentrations. However, of that amount, approximately 1,200 pounds was injected into a total of nine injection points. Problems encountered included "daylighting" of ORC/Regenox and low flow rates (less than 1 gpm) combined with high injection pressures (greater than 50 psi). Based on the problems encountered, EAB through the addition of ORC/Regenox is not suitable to site conditions.

Evaluate Effectiveness of EAB injections

Data collected during the three-month monitoring period suggest that ORC/Regenox is effective in reducing benzene and toluene concentrations at the Site, but further monitoring is needed to determine its effectiveness in reducing TPHd and TPHg concentrations. Benzene and toluene decreased from pre-injection concentrations of 180 ug/L and 2.9 ug/L, respectively (May 2009) to 5.7 and 0.36 ug/L, respectively (September 2009). TPHg and TPHd concentrations have remained relatively stable during post-injection monitoring. A graph illustrating TPH concentrations for well MW-9 is included as Figure 4.

Evaluate Longevity of EAB Injections

This objective seeks to evaluate if ORC/Regenox has sufficient longevity to treat the required contamination within the target area. DO concentrations in well MW-9 were approximately 0.96 milligrams per liter (mg/L) prior to injection activities (May 2009). Following injection activities, DO concentrations increased to 88.53 mg/L (July 2009) and then decreased to 55.00 mg/L (August 2009) and 25.75 mg/L (September 2009) indicating that ORC/Regenox appears to be effective in maintaining elevated DO concentrations. Further monitoring is needed to determine how long concentrations remain elevated in the injection area.

5.0 CONCLUSIONS

In June 2009, an EAB pilot study was conducted in the warehouse to promote the breakdown of TPH through addition of ORC and Regenox. A total of 1,200 lbs of ORC/Regenox were injected into nine locations in the warehouse. Data collected over three months suggests that injection activities were effective in raising DO levels and reducing benzene and toluene concentrations. However, TPHg and TPHd concentrations remained relatively stable. Further monitoring will be required to evaluate TPHg and TPHd concentrations trends and to confirm that DO levels remain elevated over time.

5	10,000	Gasoline	Removed	1982 through early 1990's
6	10,000	Gasoline	Removed	1982 through early 1990's
7	10,000	Gasoline	Removed	1982 through early 1990's

II. RELEASE INFORMATION

- Source of Release: USTs
- Date Release Reported: 8 May 1991
- Affected Media: Soil and groundwater

III. SITE CHARACTERIZATION INFORMATION

A. Site Information

SITE DESCRIPTION:
The Site is located at 7825 San Leandro Street, east of the intersection with 77th Avenue in a light industrial area of Oakland. The Site is bound by commercial/industrial properties to the north, south, east, and west. Union Pacific Railroad is located immediately adjacent to and west of the Site. Oakland Truck Stop is located immediately adjacent to and east of the Site. Elmhurst Creek is located along the southeast corner of the property. San Leandro Bay is located approximately one mile west of the Site.

GW BASIN: East Bay Plain Groundwater Basin

CURRENT LAND USE: Unassigned
BENEFICIAL USES: Municipal and domestic supply, other groundwater (uses other than drinking water)

DISTANCE TO NEAREST SUPPLY WELL: According to GeoTracker, no wells identified within ½ mile of the site.

MINIMUM GROUNDWATER DEPTH: Historical groundwater data was not tabulated in the reports reviewed.

MAXIMUM GROUNDWATER DEPTH: Historical groundwater data was not tabulated in the reports reviewed.

FLOW DIRECTION: - northwest

SOIL TYPES: - The sediments beneath the Site consist of unconsolidated, moderately sorted fine sand and silt, with clayey silt and occasional thin beds of coarse sand.

MAXIMUM DEPTH SAMPLED: 20 feet bgs.

B. Monitoring Well Information

Well Designation	Date Installed	Screen Interval (feet bgs)	Most Recent DTW April 2010
MW-1	NA	10-20	6.14
MW-2	--	8-17	Destroyed
MW-2R	August 2006	5-20	4.01
MW-3	NA	9-19	6.87
MW-4	NA	10-25	6.82
MW-5	August 2006	5-20	7.77
MW-6	August 2006	5-20	7.89
MW-7	August 2006	5-20	6.56
MW-8	August 2006	5-20	7.92
MW-9	August 2006	5-20	4.26

NM - Not measured

IV. MAXIMUM DOCUMENTED CONTAMINANT CONCENTRATIONS

NA Not Analyzed, Not Applicable or Data Not Available
WQO ESTIMATED WATER QUALITY OBJECTIVES (WQO'S) FOR SITE: Per the Region 2, Water Quality Control Plan (Basin Plan).

V. FREE PRODUCT: No data was found in files reviewed.

VI. VI. SOIL AND GROUNDWATER REMEDIATION

A. Soil Excavation:

During the combined UST removal activities approximately 680 cubic yards of affected soil was removed, transported and disposed.

B. In-Situ Soil Remediation: None discussed

C. Groundwater Remediation: Currently two pilot studies are being evaluated at the Site;

2009 through present – A pilot study is underway testing enhanced anaerobic biodegradation (EAnB) on the dissolved chlorinated solvents beneath the Site. EAnB is promoted through the in-situ addition of an emulsified oil substrate (EOS□), a carbon-donating substance, into the affected groundwater unit.

2009 through present - The primary purpose of the pilot study is to evaluate the ability to reduce the mass of petroleum hydrocarbons in the Former Three 10,000-Gallon USTs Area using Oxygen Releasing Compound and Regenox solution (ORC/Regenox).

D. Groundwater Trends: The TPH and associated compound concentrations are decreasing with time and will reach WQO's within a reasonable timeframe.

VII. SENSITIVE RECEPTOR SURVEY:

Vapor intrusion – Only vinyl chloride (VC) exceeded its environmental screening level (ESL) in the warehouse for vapor intrusion into indoor air under the commercial land use scenario. In addition, beneath the office building soil vapors exceed the ESL for both VC and PCE for commercial land use.

VIII. COMMENTS AND JUSTIFICATION FOR RECOMMENDED ACTION

A. Site Description: The Site is located at 7825 San Leandro Street, east of the intersection with 77th Avenue in a light industrial area of Oakland.

B. Site History:

1930 through present – AB&I has operated on the same site since at least 1930. Activities include the manufacture of cast pipe and fittings. The facility accepts scrap iron and steel which it stockpiles on-Site and uses during manufacturing activities.

2007 through 2008 – Soil and groundwater assessment is completed for both the shallow and deep groundwater and soil vapor sampling has also occurred.

C. Groundwater Monitoring Summary: Groundwater monitoring has occurred intermittently since 1993.

D. Remediation Summary: Some TPH affected soil removal has been completed and two groundwater pilot studies are currently underway.

E. Contaminant Exposure Pathway Evaluation: **Recommendation:** The UST Fund staff has completed a 5-Year Review of this Claim. The staff offers the following recommendations for consideration.

- The UST Fund staff notes that the LOP has not accepted "any" of the claimant's GeoTracker submittals. Please review and accept as soon as possible in order for the LOP to be in compliance with contract requirements.
- The UST Fund staff recommends closing the UST portion of the Site and concentrating effort on the chlorinated solvents remaining at the Site.

CERTIFICATION

All hydrogeologic and geologic information in this document regarding the AB&I Foundry Site have been prepared under the supervision of and reviewed by the certified professional whose signature appears below.

Jon Philipp, P.G., C.HG.
Senior Hydrogeologist
The Source Group, Inc.

1.0 INTRODUCTION

On behalf of AB&I Foundry (AB&I), The Source Group, Inc. (SGI) has prepared this July 2010 Semi-Annual Monitoring and Request for Site Closure (Report) for the AB&I Foundry Site located at 7825 San Leandro Street in Oakland, Calfornia (Figure 1; Site). This Report was prepared for submittal to the Alameda County Environmental Health Department (ACEH). It presents the results of quarter 1 and quarter 2, 2010 semi-annual monitoring activities as required in the ACEH letter dated March 2, 2010. In addition, this report is a formal request for Site closure. Monitoring results have confirmed the effectiveness of past remedial efforts and results indicate that the residual petroleum and VOC impacts remaining do not pose any risk to human health or the environment, based on the current land use. It is proposed that the residual impacts in soil and groundwater be addressed through preparation of a risk management plan and deed restriction.

2.0 BACKGROUND

The Site is located at 7825 San Leandro Street, east of the intersection with 77th Avenue, in a light industrial area of Oakland (Figures 1 and 2). The Site is bounded by commercial/industrial properties to the north, south, east, and west. Union Pacific Railroad is located immediately adjacent to and west of the Site. Oakland Truck Stop is located immediately adjacent to and east of the Site. Elmhurst Creek is located along the southeast corner of the property (Figure 2). San Leandro Bay is located approximately one mile west of the Site.

AB&I have been operating at the Site location since at least 1930 (BSK Associates [BSK], 1993). Business activities include the manufacture of cast pipe and fittings. The facility accepts scrap iron and steel, which it stockpiles on-site, and uses during manufacturing activities. The Site encompasses an area of approximately 11.8 acres and contains various warehouses, manufacturing and office buildings. The entire Site is covered with buildings and asphalt/concrete pavement. Seven underground storage tanks (USTs) were previously located on the Site, including one 8,000-gallon UST used for storing unleaded gasoline, one 8,000-gallon UST used for the storage of mineral spirits and later 1,1,1-trichloroethane (1,1,1-TCA), one 550-gallon UST used for storing regular leaded gasoline, one 10,000-gallon UST used for storing diesel, and three 10,000-gallon USTs used for storing gasoline. All UST have been removed from the Site. UST removal activities were initiated in 1982 and completed in the early 1990s.

2.1 Historical Investigations

Initial site assessment activities began in 1991 as part of the facility's UST removal program. The USTs removed consisted of:

- three 10,000-gallon tanks used for storing gasoline (removed 1982/1983);
- one 8,000-gallon tank used for storing unleaded gasoline (removed 1991);
- one 8,000-gallon tank initially used for storing mineral spirits and later for storing 1,1,1-trichloroethane (removed 1991); and
- one 10,000-gallon tank used for storing diesel fuel (removed 1992).

Removal of the tanks, with the exception of the three 10,000-gallon gasoline USTs were provided in UST closure reports. Locations of the former USTs are included on Figure 2.

In July/August 2006, a soil and groundwater assessment was conducted as part of a property transfer. The assessment consisted of sampling three existing monitoring wells (MW-1, MW-3, and MW-4); abandoning damaged well MW-2; and installing and sampling six new groundwater monitoring wells (MW-2R, and MW-5 through MW-9). Soil samples were collected at various

depth intervals during the installation of monitoring wells MW-5, MW-6, MW-7, and MW-8. Results of the assessment were presented in the Preliminary Groundwater Investigation Report (BSK, 2007).

In response to request from ACEH, additional groundwater and soil vapor investigations were conducted in 2007 and 2008. These investigations included the investigation of shallow groundwater (less than 30 feet below ground surface [bgs]) and deep groundwater (greater than 30 feet bgs), and the collection of soil vapor samples. The results of these investigations indicated that shallow groundwater in the vicinity of the Parking Lot Area (located in the vicinity and northwest of well MW-8; Figure 2) was impacted with chlorinated VOCs, including 1,1,1-TCA, 1,1-dichloroethane (1,1-DCA), 1,1-dichloroethene (1,1-DCE), chloroethane, cis-and trans-1,2-dichloroethene (1,2-DCE), and vinyl chloride. Shallow groundwater in the vicinity of the Former Three 10,000 Gallon USTs Area (located in the vicinity of well MW-9) was impacted with petroleum fuels including benzene, toluene, ethylbenzene and xylenes (BTEX), total petroleum hydrocarbons as gasoline (TPHg), and total petroleum hydrocarbons as diesel (TPHd). Results of the soil vapor analysis indicated that isolated soil gas samples had indoor air vapor intrusion environmental screening level (ESL) exceedences for benzene, ethylbenzene, vinyl chloride and tetrachloroethene (PCE) under the commercial land use scenario. A site specific risk assessment was conducted and results concluded that the risks posed by soil vapors were acceptable and did not require further action. Further details can be found in SGI's reports titled, "Site Investigation Report" and "Additional Site Investigation Report" (SGI 2008a; SGI 2008b). ACEH concurred with the report conclusions in a letter dated May 20, 2009.

In order to address residual petroleum hydrocarbons and VOCs in groundwater, in June 2009, enhanced anaerobic biodegradation (EAnB) injections occurred at the Site beneath the parking lot area (near MW-3 and MW-8) and aerobic biodegradation (EAB) injections occurred near the former three 10,000 gallon USTs (near MW-9). Additional details regarding the injections are provided in Sections 4 and 5 of this report. Since that time, groundwater monitoring has occurred to monitor the progress of bioremediation in the subsurface.

2.2 Hydrogeological Setting

The Site is located near the San Francisco Bay within an area identified as the East Bay Plain. The East Bay Plain is situated on the east side of the San Francisco Bay depression. The alluvial sediments of the East Bay Plain consist of a mixture of gravel, sand and clay deposited by coalescing alluvial fans. In the vicinity of the Site, fluvial and near shore deposits have been mapped (Helley et. al., 1979). The fluvial deposits are described as unconsolidated, moderately sorted, fine sand and silt, with clayey silt and occasional thin beds of coarse sand (Muir, 1993). The near-shore deposits are described as a well-sorted, fine to medium grained sand and silt, with lenses of sandy clay and clay. Regional groundwater flow in the vicinity of the Site is interpreted to be towards the west - southwest toward San Leandro Bay.

The Site is underlain by a mixture of sandy/silty clay to a depth of at least 20-feet bgs. Groundwater has been encountered in borings and excavations at depths ranging from 8 to 12-feet bgs at the Site. Groundwater monitoring data from on-site monitoring wells generally flows to the northwest at a gradient of approximately 0.006 feet per foot (ft/ft); (SGI 2009a).

Based on the Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan) (RWQCB, 1995), groundwater beneath the site is part of the East Bay Plain basin, which has beneficial uses for municipal and domestic drinking water supply, industrial process and service water supply, and agricultural water supply. That said, East Bay Municipal Utility District (EBMUD) provides water for these uses to the site and vicinity from Sierra-fed surface-water sources. Development of the shallow water-bearing zones beneath the site for beneficial uses is remote due to uneconomically low, sustainable well yields, and the presence of regional contamination (e.g., coliform from leaking sanitary sewer lines, unrelated chemical plumes), and presence of more productive water-bearing zones at depth (RWQCB, 1999). In addition, State regulations require sealing of at least the upper 50 feet of subsurface for public/industrial water supply wells (Department of Water Resources, 1991).

3.0 SEMI-ANNUAL MONITORING ACTIVITIES

Monitoring of all nine wells (MW-1, MW-2R, and MW-3 through MW-9) was conducted on July 9, 2010. Monitoring activities included water level gauging and groundwater sampling. Wells in enhanced bioremediation areas (MW-3, MW-8, and MW-9) were additionally sampled on April 9, 2010.

3.1 Monitoring Well Inspection and Gauging

Upon arrival at the Site the wells were located, inspected, and judged to be secure and in good condition. The wells were then gauged for depth to water and total well depth using an electronic water level meter. The water level meter was properly decontaminated between successive wells. Well gauging data are provided in Table 1.

3.2 Groundwater Sampling

Prior to sampling, the wells were purged using low-flow (i.e., low stress) procedures. Purging and sampling was performed using a peristaltic pump with dedicated tubing. During purging, water quality parameters including pH, temperature, electric conductivity (EC), oxidation-reduction potential (ORP), and dissolved oxygen (DO) were monitored to ensure that groundwater representative of the aquifer was entering the well. Convergence of these parameters on successive measurements was used as an indicator that the wells had been adequately purged. Copies of the Monitoring Well Purging/Sampling Field Forms are included in Appendix A.

All nine wells were sampled on July 8 through 9, 2010. Wells MW-3, MW-8, and MW-9 were additionally sampled on April 9, 2010. Groundwater samples were collected in laboratory-supplied containers, appropriate for the specified analysis. All containers were capped, labeled, placed on ice, and transported under chain-of-custody to Advanced Technology Laboratories (ATL), located in Signal Hill, California, for analysis of VOCs using EPA Method 8260B and TPHg and TPHd using EPA Method 8015M. In addition, samples collected from wells MW-3 and MW-8 were analyzed for total organic carbon (TOC) using method SM5310B and methane, ethane, and ethene using method RSK-175. During the July sampling event, a field duplicate sample was collected from MW-8. An equipment blank and trip blank, analyzed for VOCs as a quality control measure, were also submitted to ATL. A copy of the laboratory analytical report is included as Appendix B.

3.3 Decontamination and Disposal Procedures

All non-dedicated or non-disposable sampling equipment was decontaminated using a triple-rinse method consisting of successive rinses of Alconox soap and de-ionized water. Rinsate and purge

water were staged on-site in properly labeled Department of Transportation approved 55-gallon drums pending waste characterization and appropriate disposal.

3.4 July 2010 Semi-Annual Monitoring Results

3.4.1 Groundwater Flow

Groundwater elevation measurements were calculated by measuring the depth to water in the wells relative to the top of the well casing then subtracting the depth to water from the elevation of the well. Groundwater elevations in wells during the July 2010 semi-annual monitoring event ranged from 2.27 feet above mean sea level (msl) in well MW-6 to 4.11 feet above msl in well MW-7 (Table 1). As shown on Figure 3, estimated groundwater flow direction during the semi-annual monitoring event was generally to the northwest at a hydraulic gradient ranging between 0.002 to 0.008 feet/foot. The groundwater flow direction and gradient are generally consistent with past monitoring events.

3.4.2 Groundwater Analytical Results

Concentrations of chlorinated VOCs and TPH detected during the July 2010 monitoring event in wells outside of the enhanced biodegradation area (MW-1, MW-2R, MW-4, MW-5, MW-6, and MW-7) were generally within historic ranges. None of these wells contained constituents with concentrations above California EPA Department of Health Services maximum concentration levels for drinking water (MCLs). Wells MW-3 and MW-8, located in the enhanced anaerobic biodegradation areas continued to exhibit decreasing VOC trends. Concentrations in well MW-9 contained stable to decreasing TPHd and BTEX concentrations. Figures 4 and 5 show the groundwater analytical results for petroleum constituents and chlorinated VOCs, respectively. A summary of analytical results is included in Table 2. A summary of historical concentrations is included as Appendix C.

4.0 ENHANCED ANAEROBIC BIODEGRADATION ACTIVITIES

EAnB injections were implemented at the Site beneath the parking lot area (near MW-3 and MW-8) in June 2009. The EAnB injection program consisted of injecting EOS® with a vitamin B-12 supplement to stimulate biodegradation. EOS® is a food-grade vegetable oil that serves as a slow-release carbon source to promote microbial activity and growth. The B-12 supplement, consisting of vitamin B-12, acetate, and extracts of mixed microbial cultures, provides a fast-release carbon source to establish enhanced anaerobic conditions. A total of 5,475 gallons of EOS® was injected to depths of 5 to 20 feet bgs using 15 direct-push injection points (PL-1 through PL-15). Figure 4 includes locations of the EAnB injection locations. Details of the injection event were presented in the May 2009 Semi-Annual Monitoring and Enhanced Anaerobic Biodegradation Pilot Study Report (SGI, 2009c).

4.1 Onsite Remediation Effectiveness Groundwater Sampling

In April and July, 2010, groundwater samples were collected from wells MW-3 and MW-8 located in the EAnB injection areas to monitor remediation effectiveness. VOC concentration trends are the primary indicator of EAnB effectiveness. Under anaerobic conditions, the breakdown pathway for the chemicals of concern at the Site are illustrated as follows:

- 1,1,1-TCA → 1,1-DCA → Chloroethane → Ethane/Methane; and
- 1,1,1-TCA → 1,1-DCE → Vinyl Chloride → Ethene.

EAnB is initially exhibited by decreasing parent VOC (1,1,1-TCA, 1,1-DCA, and 1,1-DCE) concentrations and temporary increasing daughter products (chlorethane, vinyl chloride and methane/ethene). As parent VOCs are depleted, daughter product concentrations will generally stabilize and subsequently decline.

Total organic carbon (TOC) was analyzed at each location to evaluate the presence and depletion of EOS® in the subsurface. As the EOS® is consumed by bacteria during the degradation process, TOC will drop to background levels (generally less than 10 milligrams per liter)

4.1.1 Onsite Remediation Effectiveness Results

Analytical results for groundwater EAnB remedial effectiveness samples are presented in Table 3. In addition, trend charts are provided as Figures 6 and 7. Consistent with previous findings, the monitoring results indicate biodegradation is occurring in groundwater beneath the injection areas. In brief, the monitoring results indicate the following:

- Well MW-3 (Figure 6): In response to EAnB injections, VOC concentrations have been reduced by approximately 90%. Parent products (1,1-DCA and 1,1-DCE) have decreased

significantly to levels that are below MCLs. Daughter product concentrations, which initially increased following EAnB injections, have subsequently decreased and are continuing to show a declining trend. Only vinyl chloride remains present at levels above MCLs. During the most recent sampling event, vinyl chloride was detected at 1.1 micrograms per liter (µg/L), compared to the MCL of 0.5 µg/L.

- Well MW-8 (Figure 7): In response to EAnB injections, VOC concentrations have been reduced by approximately 70%. Following the injection event, parent products (1,1,1-TCA, 1,1-DCA and 1,1-DCE) decreased and a temporary increase of daughter products (chloroethane, methane, vinyl chloride, and ethene) was observed. Concentrations of daughter products have subsequently decreased. 1,1-DCA, vinyl chloride, and benzene are the only constituents that remain above MCLs. During the most recent sampling event, 1,1-DCA, vinyl chloride and benzene were detected at 18 µg/L, 2.9 µg/L, and 2.4 µg/L, respectively.

5.0 ENHANCED AEROBIC BIODEGRADATION ACTIVITIES

EAB injections were implemented at the Site near the former three 10,000 gallon USTs (near MW-9) in June 2009. The EAB injection program consisted of injecting Oxygen Releasing Compound (ORC) and Regenox solution (ORC/Regenox), both of which are manufactured by Regenesis, into the affected groundwater unit. A total of 2,018 gallons ORC/Regenox were injected to depths of 5 to 20 feet bgs using nine direct-push injection points (WH-1 through WH-9). Figure 4 includes the locations of EAB injection locations. Details of the injection event were presented in the Enhanced Aerobic Biodegradation Pilot Study Report – Former Three 10,000-Gallon USTs Area (SGI, 2009d).

5.1 Onsite Remediation Effectiveness Groundwater Sampling and Results

During June 2010, groundwater samples were collected from well MW-9 located in the EAB injection area to monitor remediation effectiveness. TPH and VOC concentration trends are the primary indicator of EAB effectiveness. Analytical results for groundwater remedial effectiveness samples are presented in Table 4 and Figure 8. Data collected since EAB injection activities in June, 2009 suggest that ORC/Regenox was initially effective at reducing benzene and toluene concentrations at the Site, but some rebounding has occurred. Benzene is the only consistent that remains above MCLs, and was most recently detected at 100 µg/l.

6.0 COMPARISON OF GROUNDWATER DATA TO ENVIRONMENTAL SCREENING LEVELS

The CRWQCB has developed environmental screening levels (ESLs) to address environmental protection goals presented in the Water Quality Control Plan for the San Francisco Bay Basin (RWQCB 2006). Goals for screening levels and their applicability to the AB&I Foundry Site are summarized in the following table:

ESL Goal	Notes	Applicability
Protection of drinking water resources	There are no known active domestic water supply wells or pumping from shallow aquifers within a 1-mile radius of the Site.	Drinking water goals are not applicable
Protection of aquatic habitats	The nearest surface water body is Elmhurst Creek, which bounds the southern, upgradient edge of the Site. Elmhurst Creek is channeled through urban areas and drains stormwater toward San Leandro Bay (approximately 1 mile from the Site). The nearest wildlife refuge (Don Edwards) is approximately 30 miles southeast of the Site.	Aquatic habitat goals are not applicable
Protection against vapor intrusion into buildings	The site is currently developed with commercial buildings where vapor intrusion into indoor air from the subsurface may occur.	Vapor intrusion goals for commercial land use are applicable
Protection against adverse nuisance conditions (taste and odor thresholds)	Groundwater beneath the Site is not used for drinking water or other beneficial use, and leaching to potable groundwater aquifers is not a complete pathway.	Nuisance condition goals (taste and odor thresholds) are not applicable.

The only ESL which applies to groundwater beneath the AB&I Foundry Site is the ESL for vapor intrusion into indoor air. ESL vapor intrusion numbers are included on the analytical data tables

(Tables 2, 3, 4, C2, and C3) and were compared with site data. Currently, none of the wells contain VOC concentrations at levels that exceed the ESLs for vapor intrusion. Historical data which exceeded vapor intrusion ESLs are shaded in grey. Only two wells have historically contained VOC concentrations at levels that exceed vapor intrusion ESLs (vinyl chloride in MW-3 and vinyl chloride in well MW-8). Concentrations in both of these wells have decreased to levels that are below ESLs as a result of the 2009 EOS® injections.

7.0 CONCLUSIONS AND RECOMMENDATIONS

In the letter dated March 2, 2010, Alameda County concurred that no further active remediation is required at the Site at this time. The County requested continued groundwater monitoring of wells MW-3, MW-8, and MW-9 to confirm the effectiveness of enhanced biodegradation. Additional monitoring of these wells occurred in April and June, 2010. Based on the recent and historical monitoring results, SGI maintains that with the development of a Site Management Plan and deed restriction for the Site, no further action is warranted and the Site may be closed based on low risk. Site Closure is warranted based on the following rationale:

- All sources have been removed from the Site. The seven underground storage tanks (USTs) were removed between 1982 and the early 1990s. No other known sources are present at the facility.
- Impacts to soil gas are low and not present at levels which warrant remediation or monitoring. A risk assessment was completed and results indicated that concentrations are present at levels that are acceptable and within the USEPA acceptable risk range. Results of soil gas sampling activities and risk assessment were presented in the Supplemental Soil Vapor Investigation Report (SGI, 2009b) and approved in the ACEH letter dated May 20, 2009.
- Groundwater monitoring has occurred at the site since 1993 and a review of the data indicates stable to declining groundwater VOC and petroleum hydrocarbon concentrations. Over the last 3 years VOC concentrations in all but three monitoring wells have been below MCLs. Bioremediation substrates were injected into the three MCL exceedance areas in 2009 and monitoring results indicated stable to declining concentrations, as summarized below.
    - Well MW-3 – Chlorinated VOCs in groundwater in the vicinity of MW-3 have historically exceeded MCLs. The only constituent which has historically exceeded vapor intrusion ESLs is vinyl chloride. In June 2009, EOS® was injected into the area (Figure 5) to promote biodegradation of VOCs. Since that time, VOC concentrations have been reduced by approximately 90% with only vinyl chloride remaining slightly above MCLs. Vinyl chloride is a daughter product of the biodegradation process. Figure 6 provides the chlorinated VOC trends in MW-3. Following the injection event, parent products (1,1-DCA and 1,1-DCE) decreased and a temporary increase of daughter products (chloroethane, methane, vinyl chloride, and ethene) was observed. Monitoring activities have confirmed that daughter products are continuing to decrease over time, are well below ESLs for vapor intrusion (Table C-3), and have reached or are approaching MCL concentrations. No futher remediation or monitoring is warranted at this location.

- Well MW-8 - VOCs in groundwater in the vicinity of MW-8 have historically exceeded MCLs. In addition, 1,1-DCA and vinyl chloride have historically exceeded vapor intrusion ESLs. In June 2009, EOS® was injected into the area (Figure 5) to promote biodegradation of VOCs. Since that time, VOC concentrations have been reduced by approximately 70% with all constituents decreasing to below vapor intrusion ESLs. 1,1-DCA, vinyl chloride, and benzene remain above MCLs. Figure 7 provides the chlorinated VOC trends in MW-8. Following the injection event, parent products (1,1,1-TCA, 1,1-DCA and 1,1-DCE) decreased and a temporary increase of daughter products (chloroethane, methane, vinyl chloride, and ethene) was observed. Monitoring activities have confirmed that daughter products are continuing to decrease over time, are well below vapor intrusion ESLs (Table C-3), and are approaching MCL concentrations. No futher remediation or monitoring is warranted at this location.
- Well MW-9 – The only constituent in well MW-9 that has historically exceeded MCLs is benzene. All constituents have consistently been below vapor intrusion ESLs. In June 2009, approximately 2,018 gallons of ORC/Regenox were injected into the area (Figure 4) to promote biodegradation of petroleum constituents. Since that time, benzene concentrations have been reduced by approximately 40%. Although recent monitoring activities have indicated a rebound in benzene and TPH concentrations, benzene and TPH concentrations in downgradient wells (MW-4, MW-2R and MW-5) are below laboratory detection limits, indicating that the relatively low residual impacts are isolated to the area in the vicinity of MW-9. No futher remediation or monitoring is warranted at this location.

SGI proposes that the residual impacts in soil and groundwater be addressed through preparation of a risk management plan and deed restriction. The risk management plan will be developed to govern future intrusive work at the Site. It will be used by parties involved in future redevelopment and/or intrusive work such as soil excavation, trenching, new construction, grading, and utility repair. In addition, a deed restriction be implemented as part of Site closure. The deed restriction will specify that the area of soil and groundwater impact would limit the Site to commercial use. It will prohibit the use of shallow groundwater as a source of drinking water, residential uses, daycares, playgrounds, schools, and hospitals. The deed restriction would follow a format acceptable to ACEH and run with the land indefinitely.

Subject: Case Closure for Fuel Leak Case No. RO0000092 and GeoTracker Global ID T0600100065, American Brass & Iron Foundry, 7825 San Leandro Street, Oakland, CA 94621

Dear Mr. Olvera and Mr. Winter:

This letter transmits the enclosed underground storage tank (UST) case closure letter in accordance with Chapter 6.75 (Article 4, Section 25299.37[h]). The State Water Resources Control Board adopted this letter on February 20, 1997. As of March 1, 1997, the Alameda County Environmental Health (ACEH) is required to use this case closure letter for all UST leak sites. We are also transmitting to you the enclosed case closure summary. These documents confirm the completion of the investigation and cleanup of the reported release at the subject site. The subject fuel leak case is closed. This case closure letter and the case closure summary can also be viewed on the State Water Resources Control Board's Geotracker website (http://geotracker.swrcb.ca.gov) and the Alameda County Environmental Health website (http://www.acgov.org/aceh/index.htm).

SITE INVESTIGATION AND CLEANUP SUMMARY

Please be advised that the following conditions exist at the site:

- Total Petroleum Hydrocarbons as diesel remain in soil at concentrations up to 5,800 ppm.
- Total Petroleum Hydrocarbons as gasoline remain in groundwater at concentrations up to 2,200 ppb.
- Vinyl chloride remains in groundwater at concentrations up to 0 97 ppb.
- Due to the residual contamination, a Covenant and Environmental Restriction was recorded for the site on September 22, 2011 The Covenant and Environmental Restriction limits future land use to the current industrial land use only. No excavation is to be conducted on the site unless expressly permitted in writing by ACEH.
- The restrictions on this site are to be entered into the City Of Oakland Permit Tracking System due to the residual contamination on the site.

If you have any questions, please call Jerry Wickham at (510) 567-6791 Thank you.

Sincerely,

Donna L. Drogos, P.E.
Division Chief

Subject: Case Closure for Fuel Leak Case No. RO0000092 and GeoTracker Global ID T0600100065, American Brass & Iron Foundry, 7825 San Leandro Street, Oakland, CA 94621

Dear Mr. Olvera and Mr. Winter:

This letter confirms the completion of a site investigation and remedial action for the underground storage tanks formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tank(s) are greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank(s) site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.3 of the Health and Safety Code and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (h) of Section 25296.10 of the Health and Safety Code. Please contact our office if you have any questions regarding this matter.

Sincerely,

Ariu Levi
Director
Alameda County Environmental Health

CASE CLOSURE SUMMARY
LEAKING UNDERGROUND FUEL STORAGE TANK - LOCAL OVERSIGHT PROGRAM

I. AGENCY INFORMATION

Date: July 20, 2011

Agency Name: Alameda County Environmental Health	Address: 1131 Harbor Bay Parkway
City/State/Zip: Alameda, CA 94502-6577	Phone: (510) 567-6791
Responsible Staff Person: Mr. Jerry Wickham	Title: Senior Hazardous Materials Specialist

II. CASE INFORMATION

Site Facility Name: American Brass & Iron Foundry		
Site Facility Address: 7825 San Leandro Street, Oakland, California 94621		
RB Case No.: 01-0071	STID No.: 523	LOP Case No.: RO0000092
URF Filing Dates: 05/29/1992	GeoTracker ID: T0600100065	APN: 41-4209-1-1, 41-4209-3-2, 41-4209-8-1, 41-4209-1-2

Tank I.D. No	Size in Gallons	Contents	Closed In Place/Removed?	Date
1 thru 3	10,000-gallons	Gasoline	Removed	Circa 1982/1983
4	8,000-gallons	Unleaded Gasoline	Removed	8/8/1991
5	550-gallons	Leaded Gasoline	Removed	8/26/1991
6	8,000-gallons	Mineral Spirits and 1,1,1-trichloroethane	Removed	10/4/1991
7	12,000-gallons	Diesel Fuel	Removed	6/3/1992
Piping			Removed	—

III. RELEASE AND SITE CHARACTERIZATION INFORMATION

Cause and Type of Release: Unknown. During removal, the tanks appeared to be intact with no holes, cracks, or other signs of obvious failure.		
Site characterization complete? Yes	Date Approved By Oversight Agency: ---	
Monitoring wells installed? Yes	Number: 10	Proper screened interval? Yes
Highest GW Depth Below Ground Surface: 3.5 feet bgs	Lowest Depth: 8.7 feet bgs	Flow Direction: Northwest
Most Sensitive Current Use: Potential drinking water source.		

Summary of Production Wells in Vicinity: The nearest water supply well is an on-site industrial water supply well located along the southwest perimeter of the Site (2S/3W/16R 01). The well is used by AB&I Foundry as a source for process (cooling) water for plant operations in conjunction with East Bay Municipal District (EBMUD) water. The well is 495 feet deep and is completed from 176 to 495 feet bgs. In 1993, approximately 362,752 gallons per day (gpd) of well water and 12,000 gpd of EBMUD water was used for plant operations. Current well water use is approximately 15,000 gpd. The on-site water supply well is sampled periodically for the Groundwater Ambient Monitoring and Assessment (GAMA) program implemented by the State Water Resource Control Board in coordination with the U.S. Geological Survey and Lawrence Livermore National Laboratory. Groundwater samples collected from the on-site water supply well in June 2007 contained low concentrations (<2 ppb) of PCE, TCE, and cis-1,2-DCE. In 2008, grab groundwater samples were collected from depths of approximately 40 to 52 feet bgs to help evaluate whether shallow groundwater encountered in the water-bearing zone less than 40 feet bgs was affecting deeper groundwater below 40 feet bgs. The deeper grab groundwater samples contained TPHg, TPHd, 1,2-DCA, TCE, cis-1,2-DCE, and vinyl chloride at concentrations below Environmental Screening Levels for current or potential drinking water. Each of these chemicals with the exception of 1,2-DCA has been detected in shallow groundwater beneath the site. Therefore, it is possible that chemicals released to shallow groundwater from the USTs have migrated downward and affected deeper groundwater at the site. However, the grab groundwater sample collected at a depth of approximately 52 feet bgs from deeper groundwater closest to the water supply well contained 1,2-DCA at a concentration of 2.2 ppb but did not contain other VOCs at concentrations above reporting limits. 1,2-DCA has not been detected in shallow groundwater in the areas of the former USTs and may be related to a regional source rather than a site source. Groundwater monitoring data collected to date indicate that VOCs released from the USTs may have migrated to deeper groundwater at low concentrations below ESLs for drinking water. These VOCs potentially may reach the on-site water supply well at de minimis concentrations. Based on the current data and expected continued decreases in VOC concentrations in groundwater expected following remediation, the on-site water supply well is not expected to be significantly impacted by releases from USTs at the Site.

A shallow well (26 feet deep) of unknown use is located approximately 200 feet north of the site at 800 77th Avenue. Based on the distance and cross gradient location from the site, the unknown well at 800 77th Avenue is not expected to be a receptor for the site. Three wells of unknown use are located approximately 1,200 feet northwest of the site at Aero Quality Plating. Based on the distance of the three wells from the site, the Aero Quality Plating wells are not expected to be receptors for the site.

The Fitchburg well group, which historically consisted of about 20 municipal supply wells, was apparently located more than approximately 500 feet southwest of the site. The precise locations and the methods used for decommissioning the Fitchburg group are unknown. Several observation wells are located at the Coliseum, approximately 1,800 to 2,200 feet west to northwest of the site. Based on the distance from the site, the Coliseum observation wells are not expected to be receptors for the site

Are drinking water wells affected? No	Aquifer Name. East Bay Plain
Is surface water affected? No	Nearest SW Name: Elmhurst Creek is located along the southeast corner of the property and is approximately 350 feet southwest of the nearest UST.
Off-Site Beneficial Use Impacts (Addresses/Locations): None	
Reports on file? Yes	Where are reports filed? Alameda County Environmental Health and Oakland Fire Department

TREATMENT AND DISPOSAL OF AFFECTED MATERIAL

Material	Amount (Include Units)	Action (Treatment or Disposal w/Destination)	Date
Tank	Three 10,000-gallon gasoline USTs	The treatment or disposal of the USTs was not reported.	Circa 1982/1983
	8,000-gallon gasoline UST	Transported to H&H Ship Service Company in San Francisco, CA for disposal	8/8/1991
	550-gallon gasoline UST	Transported to H&H Ship Service Company in San Francisco, CA for disposal	8/26/1991
	8,000-gallon solvent UST	Transported to Erickson, Inc. in Richmond, CA for disposal	10/4/1991
	12,000-gallon diesel UST	Transported to H&H Ship Service Company in San Francisco, CA for disposal	6/3/1992
Piping	Not reported	Transported to H&H Ship Service Company in San Francisco, CA for disposal	Various
Free Product	—	—	—
Soil	15-25 cubic yards	Gasoline-affected soil removed from the 8,000-gallon gasoline tank (#4) excavation was spread on a concrete pad at the site for aeration. After sampling, the soil used for backfill for the 550-gallon gasoline tank pit in another area of the site.	9/1991
Soil	40-60 cubic yards	Gasoline-affected soil removed from the 550-gallon gasoline tank (#5) excavation was spread on a concrete pad at the site for aeration. After sampling, the soil used for backfill for the 8,000-gallon solvent tank pit in another area of the site.	9/1991
Soil	180 cubic yards	Solvent-affected soil removed from the tank excavation was spread on a concrete pad at the site for aeration. After sampling, the soil was reportedly used off-site for fill at an "R&A Trucking Project.".	10/1991
Soil	180 cubic yards	Excavated soil was stockpiled inside a covered building. The soil reportedly underwent a biological treatment by BioConverters, Inc. until the concentrations were less than 1,000 ppm. The soil was then sent to the BFI Vasco Road Landfill for disposal. .	6/1992

Footnotes:

(1) The maximum concentration before cleanup is from a grab groundwater sample collected from boring SB-08 at 17 feet bgs on October 31, 2007; the maximum concentration after cleanup is the maximum concentration detected during the most recent sampling event on 12/22/2010.
(2) The maximum concentration before cleanup is from a grab groundwater sample collected from boring SB-26 at 10 feet bgs on November 2, 2007; the maximum concentration after cleanup is the maximum concentration detected during the most recent sampling event on 12/22/2010.
(3) The maximum concentration before cleanup is from a groundwater sample collected from well MW-9 on August 6, 2006; the maximum concentration after cleanup is the maximum concentration detected during the most recent sampling event on 12/22/2010.
(4) Lead = 970 ppm; cadmium = 3.4 ppm; chromium = 310 ppm; nickel = 87 ppm; and zinc = 550 ppm.
(5) MTBE, EDB, and EDC <0.0005 ppm; TAME, ETBE, DIPE, and TBA not analyzed.
(6) MTBE = 11 ppb; TBA = 15 ppb; TAME, ETBE, DIPE, EDB, and EDC not detected at various reporting limits.
(7) Napthalene = 2,100 ppm; acenapthalene = 1,300 ppm; benzo(a)pyrene = 960 ppm in tar-like substance encountered in boring SB-26.
(8) Napthalene = 2.5 ppb; no other PAHs detected above various reporting limits.

Site History and Description of Corrective Actions:

The site, which contains various warehouses, manufacturing, and office buildings, is an approximately 11.8 acres industrial facility in Oakland, CA. Site activities include the manufacture of pipe and fittings. AB&I has been operating at the facility since at least 1930. Surrounding land use is mixed commercial and industrial.

Three gasoline underground storage tanks (USTs) were removed from the site circa 1982 to 1983. No reports are available to document the removal of the three USTs. Mr. Dave Robinson indicated that based on interviews with Mr. Frank Cole (former AB&I employee) the USTs were part of a service station operated by the Olympic Oil Company and included two fuel dispensers and three 10,000-gallon gasoline USTs. In 1972, AB&I purchased the property containing the service station. In 1977, the two fueling dispenser islands were removed and replaced by a single dispenser. All three USTs and the dispenser were reportedly removed by AB&I circa 1982/1983 (no longer depicted in a 1983 aerial photograph). The final disposition of the tanks is unknown. Mr. Frank Cole indicated that based on his recollection, the excavation was backfilled using soil generated from the removal of the USTs and imported soil. No confirmatory or UST closure samples were known to have been collected.

Between August 1991 and June 1992, four USTs (8,000-gallon gasoline, 550-gallon gasoline, 8,000-gallon solvent, and 10,000-gallon diesel) were removed from four separate areas of the site. Limited overexcavation was apparently conducted during the removals. Between August 5 and 8, 1991, an 8,000-gallon gasoline UST and associated piping were removed. Approximately 20 cubic yards of soil was removed from the tank pit. On August 26, 1991, a 550-gallon UST and associated piping were removed. Residual contamination along the west and south sides of the tank pit could not be removed by excavation due to the presence of underground utilities and foundations.

On October 4, 1991, an 8,000-gallon solvent UST was removed. The UST was used for storage of mineral spirits and later 1,1,1-trichloroethane (TCA). The excavation was extended 4-6 feet from the sides of the tank pit to remove approximately 180 cubic yards of contaminated soil. A tar-like substance was observed at a depth of 3.5 feet bgs along the northern side of the excavation. The tar-like substance was removed from portions of the northeast corner and northernmost area but due to difficulties in removing the concrete surface structures, excavation of the tar-like substance was terminated.

On June 3, 1992, a 10,000-gallon diesel UST was removed from the southern portion of the site. Approximately 180 cubic yards of soil was removed during the excavation. The excavation was stopped due to difficulty in removing a concrete surface slab.

Following the UST removals, four groundwater monitoring wells (MW-1 through MW-4) were installed on February 17 and 18, 1993, adjacent to each of the four former USTs (within 10 feet of the tank excavations). One shallow soil boring was to have been angled beneath the office building adjacent to the former 550-gallon gasoline UST to assess potential contamination beneath the building foundation; however, the boring could not be advanced due to overheard power lines. Elevated concentrations of petroleum hydrocarbons were reported in soil and groundwater samples from wells MW-1, MW-2, and MW-4.

Quarterly sampling of the four monitoring wells was conducted from 1993 to 1997. No investigations other than groundwater sampling appear to have taken place between 1993 and 2006.

In July 2006, a soil and groundwater assessment was conducted as part of a property transfer. Monitoring well MW-2 was found to be damaged and was replaced by well MW-2R. Five additional groundwater monitoring wells (MW-5 through MW-9) were installed between August 12 and 18, 2006.

On November 2, 2007, soil gas samples were collected from 10 locations to assess potential vapor intrusion to indoor air.

A total of 37 soil borings were advanced in November 2007 to address data gaps and define the source and extent of TPH and VOC-affected soil and groundwater. Six additional borings were advanced in the parking lot area along the eastern boundary of the site to assess the lateral extent of VOC-affected groundwater. TPHg, TPHd, BTEX, MTBE, TBA, and chlorinated VOCs were detected in groundwater beneath the site. Groundwater monitoring was continued in 2008.

On July 7, 2008, ten soil gas samples were collected at five locations to assess the potential for vapor intrusion to the office building adjacent to the 550-galon gasoline UST area. Tetrachloroethene (PCE) and vinyl chloride were detected in soil gas at maximum concentrations of 3.7 and 2.1 microgram per liter, respectively. The concentrations of PCE and vinyl chloride in soil gas exceeded the environmental screening level (ESL) under a commercial land use scenario. The detections of PCE and vinyl chloride did not appear to correlate to areas of PCE and vinyl chloride in groundwater and were interpreted to be related to surface spills.

Site History and Description of Corrective Actions (*continued*):

Between July 8 and 12, 2008, 14 soil borings (SB-38 through SB-42 and SB-44 through SGI-52) were advanced. The soil borings were originally planned to be advanced to a depth of approximately 50 feet bgs; however, refusal and heaving sands were encountered in eleven of the borings (SB-38 through SB-48). To address the refusal and heaving sands issues, four borings (SB-49 through SB-52) were advanced using a direct push electrical conductivity probe. A total of six soil samples were collected from the borings. Nine grab groundwater samples were collected at seven locations to assess the vertical extent of TPH and VOC-impacted shallow and deep groundwater and to evaluate the potential for contaminated groundwater to impact the water supply well located on-site. TPHg, TPHd, 1,2-DCA, TCE, cis-1,2-DCE, and vinyl chloride were detected in deep groundwater underlying the site. Of these compounds, TPHg, TPHd, TCE, cis-1,2-DCE, and vinyl chloride were also detected in shallow groundwater. Based on the detection of contaminants in both shallow and deep groundwater, shallow contamination may be affecting deep groundwater. However, the presence of 1,2-DCA in deep groundwater but absence of 1,2-DCA in shallow groundwater was interpreted as a possible off-site source. None of the concentrations of TPH and VOCs exceeded drinking water ESLs.

On March 13, 2009, three soil gas samples (SG-17 through SG-19) were collected in the area of the employee training classroom, locker room, and lunchroom. PCE and benzene were the only compounds detected. PCE was detected at a concentration of 3.1 µg/L in sample SG-19 collected in the area of the lunchroom, which exceeds the ESL for indoor air vapor intrusion under the commercial land use scenario of 1.4 µg/L. A site-specific risk assessment for PCE in SG-19 estimated an excess cancer risk of 9 x 10-06, which is within range of 10-04 to 10-06, where the need for active remediation or risk management is evaluated on a site-specific basis. Based on the isolated detection beneath the lunchroom, the conservatism of the exposure assumptions used in the risk assessment in comparison to occupancy of the lunchroom, and the presence of a 12-inch thick concrete slab beneath the lunchroom, soil vapor beneath the lunchroom, active remediation does not appear to be warranted.

In June 2009, an enhanced aerobic biodegradation pilot study was conducted in the area of three former 10,000-gallon USTs to promote the breakdown of petroleum hydrocarbons through the addition of Oxygen Releasing Compound® (ORC) and Regenox®. A total of 1,200 pounds of ORC was injected in nine locations in the three former 10,000-gallon USTs. Groundwater monitoring data collected from June 2009 through December 2010 indicate that injection activities were initially effective in raising dissolved oxygen levels and reducing benzene and toluene concentrations but some rebound has occurred. However, TPHg and TPHd concentrations remained relatively stable.

An enhanced anaerobic biodegradation pilot study was conducted in the parking lot area to promote the breakdown of chlorinated VOCs via reductive dechlorination through addition of EOS®, which is a food-grade vegetable oil that serves as a slow-release carbon source. A total of 5,745 gallons of EOS® was injected into 15 locations in June 2009. Groundwater monitoring since June 2009 indicate generally stable to declining concentrations. Significant decreases in chemical concentrations have taken place in the areas of wells MW-3 and MW-8.

IV. CLOSURE

Does completed corrective action protect existing beneficial uses per the Regional Board Basin Plan? Yes		
Does completed corrective action protect potential beneficial uses per the Regional Board Basin Plan? Yes		
Does corrective action protect public health for current land use? Alameda County Environmental Health staff does not make specific determinations concerning public health risk. However, based upon the information available in our files to date, it does not appear that the release would present a risk to human health based upon current land use and conditions.		
Site Management Requirements: Case closure for the fuel leak site is granted for the current industrial land use only. This closure applies only to the former UST systems described in Sections II and III. Restrictions on future land use are described in the "Covenant and Environmental Restriction on Property" that is included as an attachment to this Case Closure Summary. This site is to be entered into the City of Oakland Permit Tracking System due to the residual contamination on site.		
Should corrective action be reviewed if land use changes? Yes		
Was a deed restriction or deed notification filed? Yes		Date Recorded:
Monitoring Wells Decommissioned: No	Number Decommissioned: 1 (MW-2)	Number Retained: 9
List Enforcement Actions Taken: None		
List Enforcement Actions Rescinded: ---		

V. ADDITIONAL COMMENTS, DATA, ETC.

Considerations and/or Variances:

This case closure only addresses unauthorized releases from the seven former USTs identified in Sections I and IV. Other environmental conditions that may exist at the site but are not related to the releases from the former USTs have not been evaluated as part of this case closure. These conditions include the detection of elevated concentrations of metals in soil samples collected from 3 of the 5 monitoring well borings advanced in August 2006. With the exception of well MW-9, these wells are not located in close proximity to the former USTs. The elevated concentrations of metals do not appear to be related to releases from the former USTs.

During removal of the 8,000-gallon 1,1,1-TCA UST, a 2 to 3-inch thick layer of a tar-like substance was encountered at a depth of approximately 3.5 feet in the northern end of the excavation. Although much of the tar-like substance was removed from the tank pit, excavation was aborted prior to full removal of the layer due to difficulty in removing a concrete surface structure. The tar-like substance appears to be unrelated to releases from the solvent tank.

The highest concentrations of 1,1,1-TCA and vinyl chloride in groundwater at the site have been detected in well MW-8, which is located approximately 150 feet west of the former mineral spirits/1,1,1-TCA tank. 1,1,1-TCA concentrations in groundwater samples collected in the area of the former solvent tank have typically been lower than concentrations measured in groundwater from well MW-8. Although, the source of 1,1,1-TCA in well MW-8 appears to be the former mineral spirits/1,1,1-TCA tank, it is possible that an unidentified secondary source of solvents could exist in the area of MW-8.

A soil vapor sample (SG-19) collected from a depth of 1.5 feet bgs beneath the lunchroom contained 3.0 µg/L of PCE. A site-specific risk assessment for PCE in SG-19 estimated an excess cancer risk of 9 x 10-06, which is within range of 10-04 to 10-06, where the need for active remediation or risk management is evaluated on a site-specific basis. Based on the isolated detection beneath the lunchroom, the conservatism of the exposure assumptions used in the risk assessment in comparison to occupancy of the lunchroom, and the presence of a 12-inch thick concrete slab beneath the lunchroom, soil vapor beneath the lunchroom, active remediation does not appear to be warranted.

Vinyl chloride was detected in soil vapor from two locations in the office building (SG-12 and SG-16B) at concentrations exceeding the ESL for vapor intrusion to indoor air. A sub-slab soil vapor sample collected from a depth of 0.5 feet bgs did not contain vinyl chloride at a concentration greater than the reporting limit of 0.05 µg/L. The south-facing side of the ground floor to the office building where SG-12 and SG-16B are located is open to the outside environment. The detections of PCE and vinyl chloride in soil vapor samples from SG-12 and SG-16B were presumed to be related to isolated surface spills and not releases from the UST systems.

Conclusion:

Alameda County Environmental Health staff believe that the levels of residual contamination do not pose a significant threat to water resources, public health and safety, and the environment under the current commercial land use based upon the information available in our files to date. No further investigation or cleanup for the fuel leak case is necessary unless a change in land use to any residential or other conservative land use scenario occurs at the site. ACEH staff recommend closure for this site.

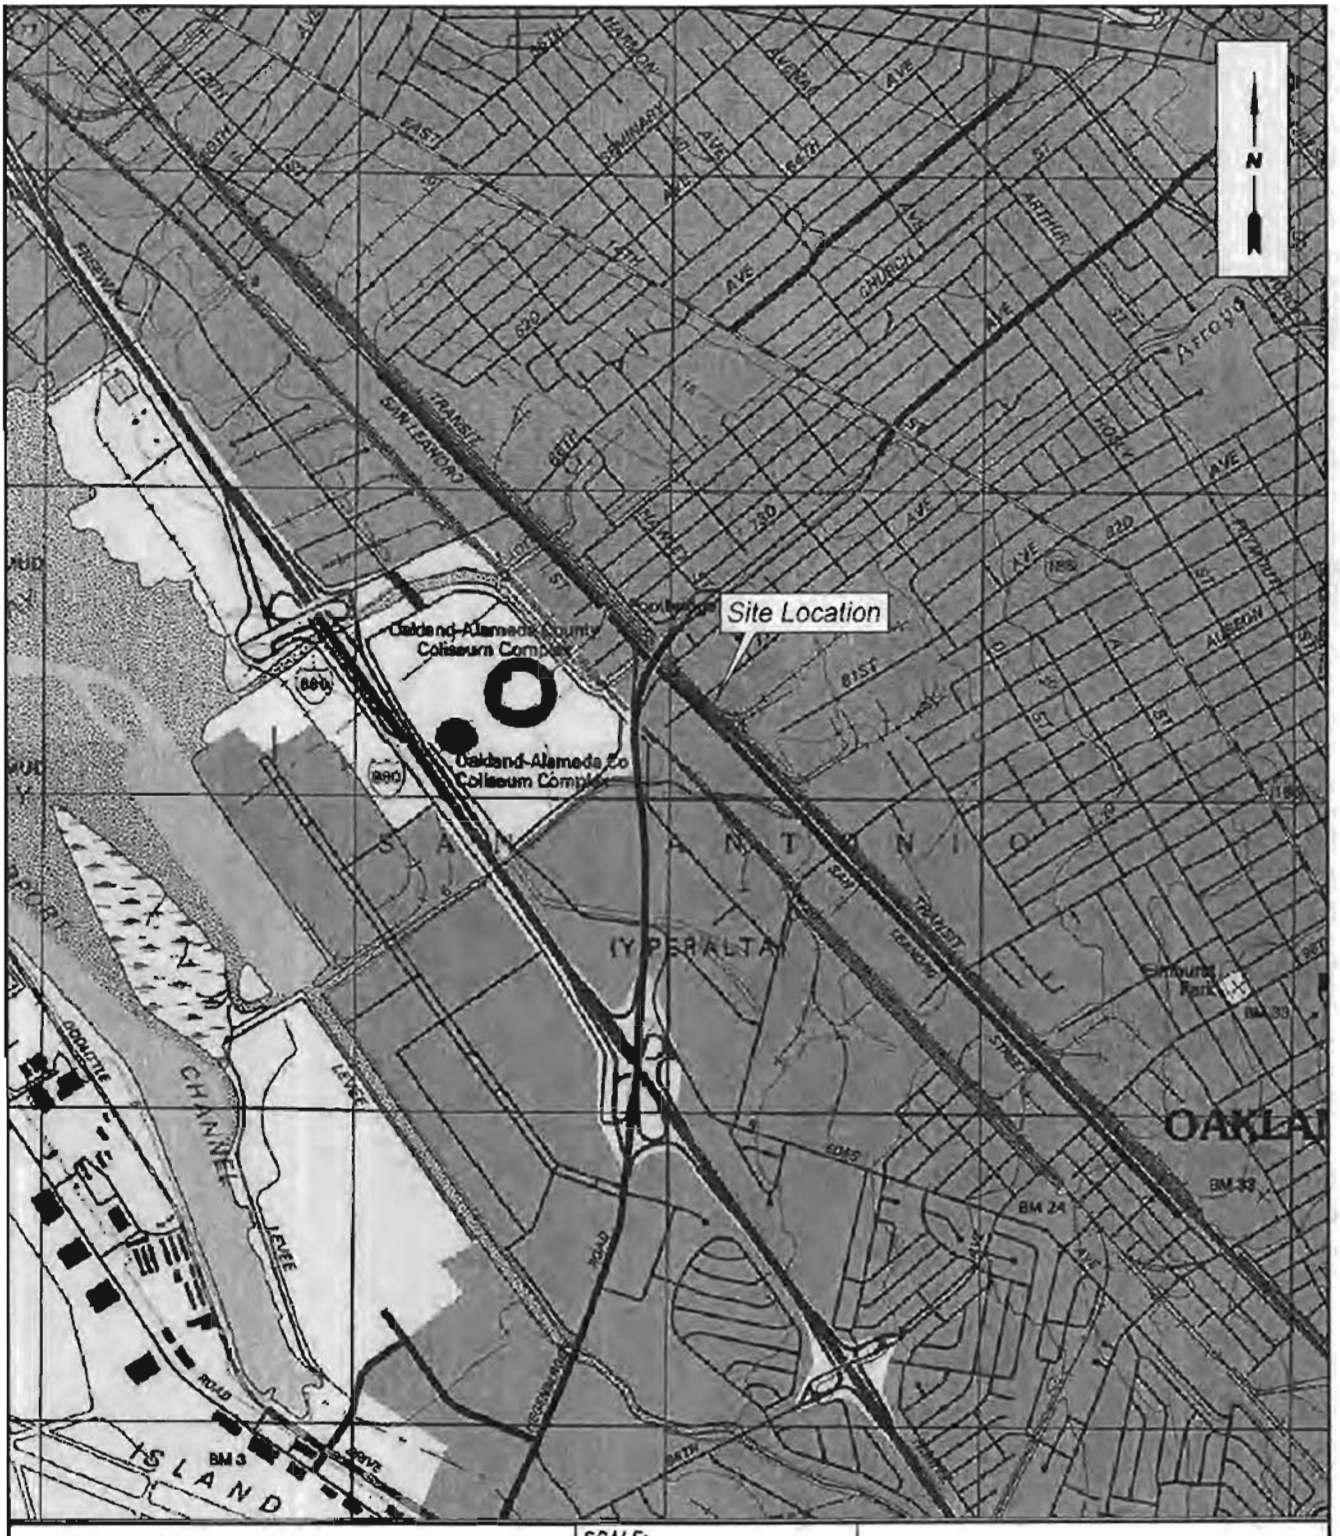
VI. LOCAL AGENCY REPRESENTATIVE DATA

Prepared by: Jerry Wickham	Title: Senior Hazardous Materials Specialist
Signature:	Date: 07/20/11
Approved by: Donna L. Drogos, P.E.	Title: Chief
Signature:	Date: 07/20/11

This closure approval is based upon the available information and with the provision that the information provided to this agency was accurate and representative of site conditions.

VII. REGIONAL BOARD NOTIFICATION

Regional Board Staff Name: Cherie McCaulou	Title: Engineering Geologist
Notification Date: 08/09/11	



VIII. MONITORING WELL DECOMMISSIONING

Date Requested by ACEH: 09/22/11	Date of Well Decommissioning Report: 11/21/11	
All Monitoring Wells Decommissioned: Yes	Number Decommissioned: 9	Number Retained: Ø
Reason Wells Retained: NA		
Additional requirements for submittal of groundwater data from retained wells: None		
ACEH Concurrence - Signature: Jerry Wickham		Date: 12/05/11

Grab Groundwater Sample (SQI, 2007)
Soil and Grab Groundwater Sample (SQI, 2007)
-Concentrations in bold exceed Environmental Screening Levels (ESLs) taken from the California Regional Water Quality Control Board, San Francisco Bay Region document entitled, "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater", Interim Final November 2007. Groundwater is not a current or potential source of drinking water, commercial shallow or deep soil (less than or greater than 3 meter), commercial land use.

Notes:

MTBE - Methyl tert butyl ether
(mg/kg) - milligrams per kilogram
TPHg - Total Petroleum Hydrocarbons as Gasoline
TPHd - Total Petroleum Hydrocarbons as Diesel
<0.005 - Not reported at or above laboratory's reporting limit of 0.005 mg/kg
UST - underground storage tank
1,1,1-TCA - 1,1,1-Trichloroethane

-TPHg, BTEX, VOCs and fuel oxygenates analyzed using EPA Method 8260B by Test America Laboratories (TAL), Pleasanton, California

-TPHd analyzed using EPA Method 8015M with silica gel cleanup by TAL, Pleasanton, California

RWQCB ESLs - Environmental Screening Levels taken from the California Regional Water Quality Control Board, San Francisco Bay Region document entitled "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater," Interim Final November 2007, groundwater is not a current or potential source of drinking water.

-Concentrations in bold exceed commercial ESLs for shallow soil (less than 3 meters).

NOTES:

All samples were analyzed by BC Anayltical Laboratory, Emeryville, California (BCA).

TPH = Total Petroleum Hydrocarbons

* TPH as gesoline is reported by BC Analytical Laboratory as C6 to C12 Hydrocarbons

** TPH as diesel is reported by BC Analytical Laboratory as C[illegible] to C[illegible] Hydrocarbons

12 25

---- Samples were not analyzed for the above analytes.

< Concentrations below laboratory detection limits.

No other EPA 8010 analytes were detected in these samples.

Samples T3-SP-1 and T3-SP-2 were collected from a stockpile of soils around the tank.

NOTES:
All samples were analyzed by BC Analytical Laboratory, Emeryville, California.

Samples SP2-N and SP2-S were post-aeration stockpile samples from soil excavated around the tank. The depth refers to the depth from the top of the stockpile.

Static ground water was not encountered.

TPH - Total Petroleum Hydrocarbons
* - TPH as gasoline is reported by BC Analytical Laboratory as C6 to C12 hydrocarbons.
** - These samples do not represent existing native soils due to re-excavation
---- - Not analyzed

T2-SP-W	12-Sep-91	---	0.70	<0.02	<0.02	<0.02	<0.02
Water Samples (results in milligrams per liter [mg/l])							
T1-WATER *	08-Aug-91	-	30.000	0.310	0.260	2.300	14.000
Pit Water	20-Aug-91	-	0.150	0.0032	0.0026	0.0062	0.026

NOTES:

All samples were analyzed by BC Anaylitical Laboratory, Emeryville, California.

Excavation depth to water was 10.5 feet on August 8, 1991, and 9.5 feet on August 20, 1991.

Samples T2-SP-W and T2-SP-E were post-aeration stockpile samples from soil excavated around the tank.

TPH = Total Petroleum Hydrocarbons

* These samples do not represent existing native soils and ground water due to re-excavation and ground-water pumping.

** TPH as gasoline is reported by BC Analytical Laboratory as C6 to C12 hydrocarbons.

Notes:
(ug/L) - micrograms per Liter
(D) - duplicate sample
1,1,1-TCA - 1,1,1-Trichloroethane
UST - Underground Storage Tank
TPHg - Total Petroleum Hydrocarbons as Gasoline
TPHd - Total Petroleum Hydrocarbons as Diesel
MTBE - Methyl tert butyl ether
TBA - Tert butyl alcohol
cis-1,2-DCE - Cis-1,2-Dichloroethylene
<0.50 - Not reported at or above laboratory's reporting limit of 0.50 µg/L
NA - Analyte not sampled for
-TPHg, BTEX, VOCs and fuel oxygenates analyzed using EPA Method 8260B by Test America Laboratories (TAL), Pleasanton, California
-TPHd analyzed using EPA Method 8015M with silica gel cleanup by TAL, Pleasanton, California
-Concentrations in bold exceed ESLs for groundwater as a current or potential source of drinking water

RWQCB ESLs[1] - Environmental Screening Levels taken from the California Regional Water Quality Control Board, San Francisco Bay Region document entitled "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater," Interim Final November 2007, groundwater is not a current or potential source of drinking water.

RWQCB ESLs[2] - Environmental Screening Levels taken from the California Regional Water Quality Control Board, San Francisco Bay Region document entitled "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater," Interim Final November 2007, groundwater is a current or potential source of drinking water.

Notes:

NE - value not established
(D) - duplicate sample
UST - Underground Storage Tank
TPHg - Total Petroleum Hydrocarbons as Gasoline
TPHd - Total Petroleum Hydrocarbons as Diesel
1,2 - DCA - 1,2-dichloroethane
trans-1,2-DCE - Trans-1,2-dichloroethene
cis-1,2-DCE - Cis-1,2-dichloroethene
1,1,1-TCA - 1,1,1-Trichloroethane
TCE - Trichloroethene
- all concentrations expressed in micrograms per liter (µg/l)
<0.50 - Not reported at or above laboratory's reporting limit of 0.50 µg/L
-TPHg, TPHd, and VOCs analyzed using EPA Methods 8015B(M) and 8260B by Advanced Technology Laboratories (ATL), Signal Hill, California
-Concentrations in bold exceed ESLs for vapor intrusion concerns - Residential Land Use
PVC - Polyvinyl chloride pipe
HP - Hydropunch

RWQCB ESLs[1] - Environmental Screening Levels taken from the California Regional Water Quality Control Board, San Francisco Bay Region document entitled "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater," Interim Final November 2007, update May 2008, commercial land use.

RWQCB ESLs[2] - Environmental Screening Levels taken from the California Regional Water Quality Control Board, San Francisco Bay Region document entitled "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater," Interim Final November 2007, updated May 2008, residential land use.

Notes:
Value in bold exceed the MCL
Shaded values exceed the ESL for vapor intrusion
[1] California Department of Health Drinking Water Program, Drinking Water Notification Level, December 14, 2007
-Historical data for sampling events conducted prior to October 2007 obtained from Table 2, Preliminary Groundater Investigation Report, AB&I Foundry, BSK Associates, Inc., dated June 11, 2007.

MCL	=	California EPA Department of Health Service Maximum concentration levels for drinking water
RWQCB ESLs (VI)	=	Regional Water Quality Control Board Environmental Screening Levels based on vapor intrusion concerns for commercial land use scenario.
ug/L	=	All concentrations reported in micrograms per liter (ug/L).
TPH	=	Total Petroleum Hydrocarbons
MTBE	=	methyl tert butyl ether
ETBE	=	ethyl tert butyl ether
TAME	=	tert-amyl methyl ether
DIPE	=	diisopropyl ether
TBA	=	tributyl alcohol
DCA	=	dichloroethane
ND	=	Not detected at or above laboratory reporting limit
<50	=	Not detected at or above laboratory reporting limit of 50 ug/L.
NS	=	Not sampled.
--	=	Not analyzed.
*500	=	Reported due to the presence of discrete peaks
J	=	analyte detected below quantitation limits

BORING LOG: MW-1

DATE: 2/17/93
LOGGED BY: T.W.B.
WATER LEVEL: 12.5 Foot depth
ELEVATION:
EQUIPMENT: Mobile Drill B-53, 8" Hollow Stem Auger

DESCRIPTION

4" concrete on raised platform.

Silty CLAY and SAND: dark to medium gray, soft to firm, moist. (FILL)

contains some small gravel

GRAVEL, CONCRETE and SLAG (?)

SAND and GRAVEL: gray, angular, fine, loose, saturated. (FILL)

Silty CLAY: mottled gray and yellow, firm to stiff, damp to moist.

SAND with some fine Gravel: Gray, medium dense.

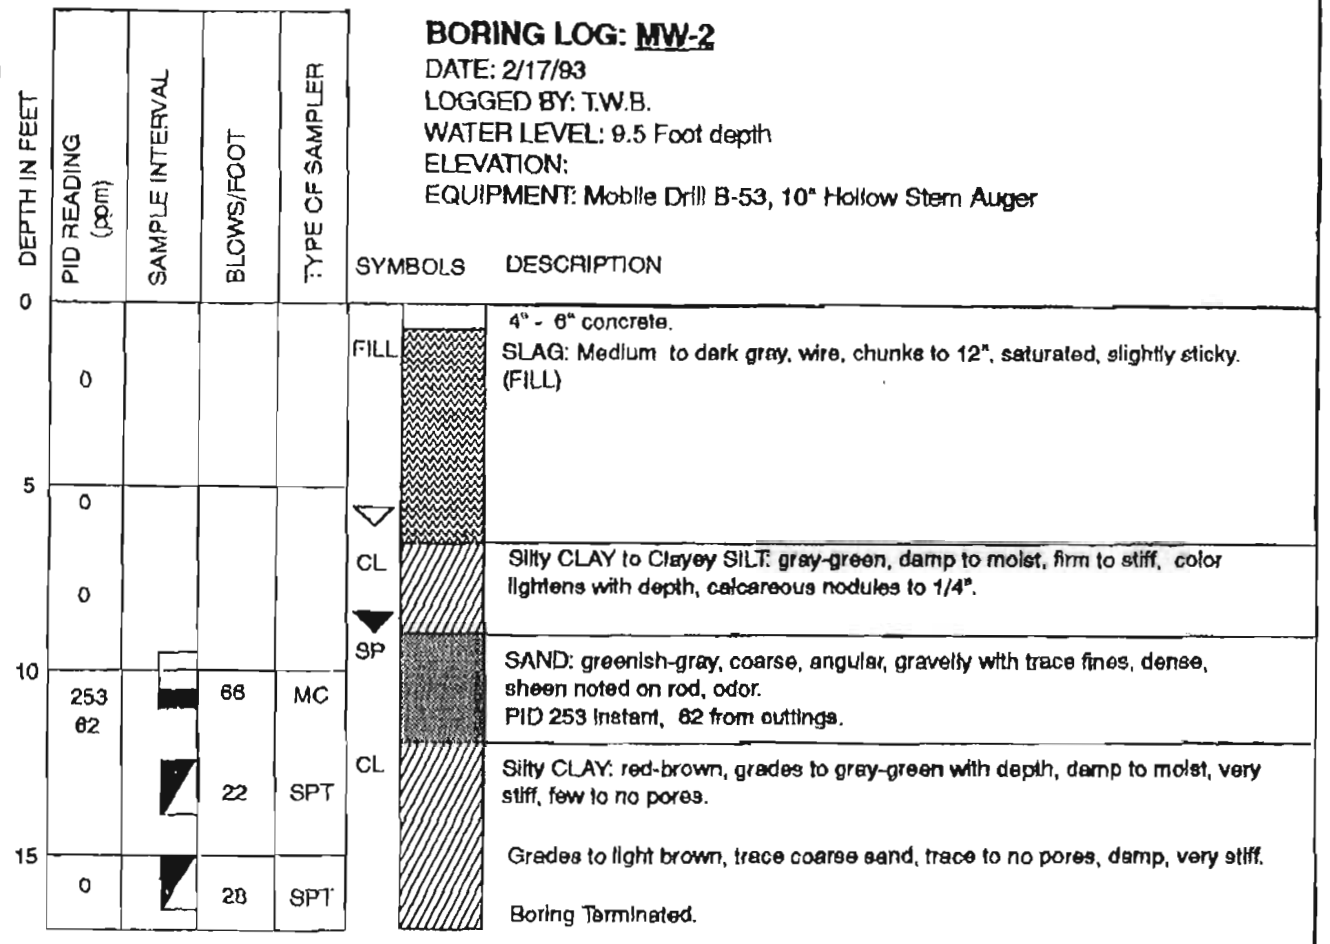
Sandy Silty CLAY: light gray-brown, damp, hard, no to few pores.

SAND: gray to reddish brown, pebbly, dense, wet, thin (1") clay -sand lenses.
no recovery

Boring Terminated.

▽ Denotes stabilized water table

▼ Denotes water table at the time of drilling



NOTES:

1. Boring completed at a depth of 23 feet on 2/17/93.
2. Sampling resistance is measured in blows per foot required to drive the sampler 12 inches with a 140 lb. hammer falling 30 inches after sampler has been seated 6 inches.
3. Boring log indicates interpreted subsurface conditions only at the location and the time the boring was drilled.
4. For an explanation of terms used see the Soil Classification Chart, Figure 3.
5. Well constructed of 2" PVC, 0.020" screen from 20' to 10', case from 10' to surface, sand from 23' to 8', bentonite from 8' to 6', cement from 6' to surface.

COVENANT AND ENVIRONMENTAL RESTRICTION ON PROPERTY

AB&I Foundry
7825 San Leandro Street
Oakland, California

This Covenant and Environmental Restriction on Property (this "Covenant") is made as of the 21st day of September, 2011 by McWane, Inc. ("Covenantor") who is the Owner of record of that certain property situated at 7825 San Leandro Street , in the City of Oakland , County of Alameda , State of California, which is more particularly described in Exhibit A attached hereto and incorporated herein by this reference (such portion hereinafter referred to as the "Burdened Property"), for the benefit of the Alameda County Environmental Health Services (the "County"), with reference to the following facts:

A. The Burdened Property and groundwater underlying the property contains hazardous materials.

B. Contamination of the Burdened Property. Soil at the Burdened Property was contaminated by previous industrial operations, including but not limited to the manufacture of cast pipe and fittings and warehousing operations and by releases from six underground fuel storage tanks formerly present at the Burdened Property. These operations resulted in contamination of soil and groundwater with organic chemicals including petroleum hydrocarbons, primarily benzene, toluene, ethylbenzene, and xylene; and chlorinated solvents, primarily 1,1,1-TCA, 1,1-dichloroethane (1,1-DCA), 1,1-dichloroethene (1,1-DCE), chloroethane, cis-and trans-1,2-dichloroethene (1,2-DCE), and vinyl chloride. These constituents constitute hazardous materials as that term is defined in Health & Safety Code Section 25260. To treat and control migration of contaminated soil and groundwater, several remedial actions were conducted at the Burdened Property including excavation and off-site disposal of contaminated

soil in the immediate vicinity of the UST areas and implementation of an enhanced biodegradation injection program.

C. Exposure Pathways. The contaminants addressed in this Covenant are present in soil and groundwater on the Burdened Property. Without the mitigation measures which have been performed on the Burdened Property, exposure to these contaminants could take place via exposure during future soil excavation resulting in dermal contact, inhalation, or ingestion by humans.. The risk of public exposure to the contaminants has been substantially lessened by the remediation and controls described herein.

D. Adjacent Land Uses and Population Potentially Affected. The Burdened Property is used for the manufacture of cast pipe and fittings and warehousing operations and is adjacent to industrial and commercial land uses and is adjacent to industrial and commercial land uses land uses.

E. Full and voluntary disclosure to the County of the presence of hazardous materials on the Burdened Property has been made and extensive sampling of the Burdened Property has been conducted.

F. Covenantor desires and intends that in order to benefit the County, and to protect the present and future public health and safety, the Burdened Property shall be used in such a manner as to avoid potential harm to persons or property that may result from hazardous materials that may have been deposited on portions of the Burdened Property.

ARTICLE I
GENERAL PROVISIONS

1.1 Provisions to Run with the Land. This Covenant sets forth protective provisions, covenants, conditions and restrictions (collectively referred to as "Restrictions") upon and subject to which the Burdened Property and every portion thereof shall be improved, held, used, occupied, leased, sold, hypothecated, encumbered, and/or conveyed. The restrictions set forth in Article III are reasonably necessary to protect present and future human health and safety or the environment as a result of the presence on the land of hazardous materials. Each and all of the Restrictions shall run with the land, and pass with each and every portion of the Burdened Property, and shall apply to, inure to the benefit of, and bind the respective successors in interest thereof, for the benefit of the County and all Owners and Occupants. Each and all of the Restrictions are imposed upon the entire Burdened Property unless expressly stated as applicable to a specific portion of the Burdened Property. Each and all of the Restrictions run with the land pursuant to section 1471 of the Civil Code. Each and all of the Restrictions are enforceable by the County.

1.2 Concurrence of Owners and Lessees Presumed. All purchasers, lessees, or possessors of any portion of the Burdened Property shall be deemed by their purchase, leasing, or possession of such Burdened Property, to be in accord with the foregoing and to agree for and among themselves, their heirs, successors, and assignees, and the agents, employees, and lessees of such owners, heirs, successors, and assignees, that the Restrictions as herein established must be adhered to for the benefit of the County and the Owners and Occupants of the Burdened Property

and that the interest of the Owners and Occupants of the Burdened Property shall be subject to the Restrictions contained herein.

1.3 Incorporation into Deeds and Leases. Covenantor desires and covenants that the Restrictions set out herein shall be incorporated in and attached to each and all deeds and leases of any portion of the Burdened Property. Recordation of this Covenant shall be deemed binding on all successors, assigns, and lessees, regardless of whether a copy of this Covenant and Agreement has been attached to or incorporated into any given deed or lease.

1.4 Purpose. It is the purpose of this instrument to convey to the County real property rights, which will run with the land, to facilitate the remediation of past environmental contamination and to protect human health and the environment by reducing the risk of exposure to residual hazardous materials.

ARTICLE II
DEFINITIONS

2.1 County. "County" shall mean the Alameda County Environmental Health Services and shall include its successor agencies, if any.

2.2 Improvements. "Improvements" shall mean all buildings, roads, driveways, regradings, and paved parking areas, constructed or placed upon any portion of the Burdened Property.

2.3 Occupants. "Occupants" shall mean Owners and those persons entitled by ownership, leasehold, or other legal relationship to the exclusive right to use and/or occupy all or any portion of the Burdened Property.

2.4 Owner or Owners. "Owner" or "Owners" shall mean the Covenantor and/or its successors in interest, who hold title to all or any portion of the Burdened Property.

ARTICLE III
DEVELOPMENT, USE AND CONVEYANCE OF THE BURDENED PROPERTY

3.1 Restrictions on Development and Use. Covenantor promises to restrict the use of the Burdened Property as follows:

a. Development of the Burdened Property shall be restricted to industrial;

b. No residence for human habitation shall be permitted on the Burdened Property;

c. No hospitals shall be permitted on the Burdened Property;

d. No schools for persons under 21 years of age shall be permitted on the Burdened Property;

e. No day care centers for children or day care centers for Senior Citizens shall be permitted on the Burdened Property;

f. No Owners or Occupants of the Property or any portion thereof shall conduct any excavation work on the Property, unless expressly permitted in writing by the County. Any contaminated soils brought to the surface by grading, excavation, trenching, or backfilling shall be managed by Covenantor or his agent in accordance with all applicable provisions of local, state and federal law. Notwithstanding the foregoing, Covenantor may perform routine landscaping and maintenance of surface improvements thereon;

g. All uses and development of the Burdened Property shall be consistent with any applicable County Cleanup Order or Risk Management Plan, each of which is hereby incorporated by reference including future amendments thereto. All uses and development shall preserve the integrity of any cap, any remedial measures taken or remedial equipment installed, and any groundwater monitoring system installed on the Burdened Property pursuant to the requirements of the County, unless otherwise expressly permitted in writing by the County.

h. With the exception of the use of the one existing onsite water supply well for industrial water supply, no Owners or Occupants of the Property or any portion thereof shall drill, bore, otherwise construct, or use a well for the purpose of extracting water for any use, including but not limited to, domestic, potable, or industrial uses, unless expressly permitted in writing by the County.

i. The Owner shall notify the County of each of the following: (1) The type, cause, location and date of any disturbance to any cap, any remedial measures taken or remedial equipment installed, and of the groundwater monitoring system installed on the Burdened Property pursuant to the requirements of the County, which could affect the ability of such cap or remedial measures, remedial equipment, or monitoring system to perform their respective functions and (2) the type and date of repair of such disturbance. Notification to the County shall be made by registered mail within ten (10) working days of both the discovery of such disturbance and the completion of repairs;

j. The Covenantor agrees that the County, and/or any persons acting pursuant to County cleanup orders, shall have reasonable access to the Burdened Property for the purposes of inspection, surveillance, maintenance, or monitoring, as provided for in Division 7 of the Water Code.

k. No Owner or Occupant of the Burdened Property shall act in any manner that will aggravate or contribute to the existing environmental conditions of the Burdened Property. All use and development of the Burdened Property shall preserve the integrity of any capped areas.

l. No Owner or Occupant of the Burdened Property shall use the Burdened Property to grow fruits or vegetables for consumption.

3.2 Enforcement. Failure of an Owner or Occupant to comply with any of the restrictions, as set forth in paragraph 3.1, shall be grounds for the County, by reason of this Covenant, to have the authority to require that the Owner modify or remove any Improvements constructed in violation of that paragraph. Violation of the Covenant shall be grounds for the County to file civil actions against the Owner as provided by law.

3.3 Notice in Agreements. After the date of recordation hereof, all Owners and Occupants shall execute a written instrument which shall accompany all purchase agreements or leases relating to the property. Any such instrument shall contain the following statement:

> The land described herein contains hazardous materials in soils and in the ground water under the property, and is subject to a deed restriction dated as of _____, 2011, and recorded on _____, 2011, in the Official Records of _____ County, California, as Document No. _____, which Covenant and Restriction imposes certain covenants, conditions, and restrictions on usage of the property described herein. This statement is not a declaration that a hazard exists.

ARTICLE IV
VARIANCE AND TERMINATION

4.1 Variance. Any Owner or, with the Owner's consent, any Occupant of the Burdened Property or any portion thereof may apply to the County for a written variance from the provisions of this Covenant.

4.2 Termination. Any Owner or, with the Owner's consent, any Occupant of the Burdened Property or a portion thereof may apply to the County for a termination of the Restrictions as they apply to all or any portion of the Burdened Property.

4.3 Term. Unless terminated in accordance with paragraph 4.2 above, by law or otherwise, this Covenant shall continue in effect in perpetuity.

ARTICLE V
MISCELLANEOUS

5.1 No Dedication Intended. Nothing set forth herein shall be construed to be a gift or dedication, or offer of a gift or dedication, of the Burdened Property or any portion thereof to the general public.

5.2 Notices. Whenever any person gives or serves any notice, demand, or other communication with respect to this Covenant, each such notice, demand, or other communication shall be in writing and shall be deemed effective (1) when delivered, if

personally delivered to the person being served or official of a government agency being served, or (2) three (3) business days after deposit in the mail if mailed by United States mail, postage paid certified, return receipt requested:

Oakland, California 94621-2598

If To: "County"
Alameda County Environmental Health Services
Attention: Director
1131 Harbor Bay Parkway
Alameda, California 94502

5.3 Partial Invalidity. If any portion of the Restrictions or terms set forth herein is determined to be invalid for any reason, the remaining portion shall remain in full force and effect as if such portion had not been included herein.

5.4 Article Headings. Headings at the beginning of each numbered article of this Covenant are solely for the convenience of the parties and are not a part of the Covenant.

5.5 Recordation. This instrument shall be executed by the Covenantor and by the Director of Environmental Health Services. This instrument shall be recorded by the Covenantor in the County of _____ within ten (10) days of the date of execution.

5.6 References. All references to Code sections include successor provisions.

5.7 Construction. Any general rule of construction to the contrary notwithstanding, this instrument shall be liberally construed in favor of the Covenant to effect the purpose of this instrument and the policy and purpose of the Water Code. If any provision of this instrument is found to be ambiguous, an interpretation consistent with the purpose of this instrument that would render the provision valid shall be favored over any interpretation that would render it invalid.

IN WITNESS WHEREOF, the parties execute this Covenant as of the date set forth above.

CERTIFICATION

All hydrogeologic and geologic information in this document regarding the AB&I Foundry Site have been prepared under the supervision of and reviewed by the certified professional whose signature appears below.

Andrew Zdon, P.G., C.HG.
Principal Hydrogeologist
The Source Group, Inc.

1.0 INTRODUCTION

On behalf of AB&I Foundry (AB&I), The Source Group, Inc. (SGI) has prepared this Revised Site Management Plan (SMP) for the AB&I Site located at 7825 San Leandro Street in Oakland, California (Figure 1; Site).

This SMP has been prepared in response to a letter submitted to AB&I by Alameda County Environmental Health (ACEH) dated April 28, 2011 (ACEH, 2011a). The ACEH April 28, 2011 letter requests that "*In order to prevent potential future exposure to residual contamination and move the site towards case closure, we request that you now submit a draft Covenant and Environmental Restriction on Property (Deed Restriction) along with a Site Management Plan (SMP).*"

An administrative control in the form of a deed restriction will be implemented as part of the case closure. The deed restriction has been prepared under separate cover and specifies that the Site will be limited in development for industrial use. Article III, section 3.1, part f of the deed restriction states:

No Owners or Occupants of the Property or any portion thereof shall conduct any excavation work on the Property, unless expressly permitted in writing by the County. Any contaminated soils brought to the surface by grading, excavation, trenching, or backfilling shall be managed by Covenantor or his agent in accordance with all applicable provisions of local, state and federal law. Notwithstanding the foregoing, Covenantor may perform routine landscaping and maintenance of surface improvements thereon.

Consistent with the deed restriction, this SMP provides a framework to manage residual chemicals in soil at the Site in a manner that is: (1) satisfactory to ACEH and other regulatory agencies, (2) protective of human health and the environment, and (3) consistent with current land uses.

This Revised SMP replaces the Revised SMP dated June 15, 2011. The Revised SMP incorporates comments provided by ACEH in their letter dated June 8, 2011 (ACEH, 2011b) and subsequent verbal comments provided on July 12, 2011.

1.1 Site Location and Description

The Site is located at 7825 San Leandro Street, east of the intersection with 77th Avenue, in a light industrial area of Oakland (Figures 1 and 2). The Site is bounded by commercial/industrial properties to the north, south, east, and west. Union Pacific Railroad is located immediately adjacent to and west of the Site. Oakland Truck Stop is located immediately adjacent to and east of the Site. Elmhurst Creek is located along the southeast corner of the property (Figure 2). San

Leandro Bay is located approximately one mile west of the Site. The entire Site is covered with concrete and asphalt/concrete pavement.

1.2 Purpose and Objectives

The purpose of this SMP is to provide a plan to prevent or minimize human exposure to soil and groundwater contamination at the Site. This SMP was prepared to govern all future redevelopment and/or intrusive work at the Site such as soil excavation, trenching and backfilling activities.

2.0 BACKGROUND

This section provides information about subsurface conditions and remediation activities at the Site.

2.1 Site Operational History

AB&I have been operating at the Site location since at least 1930 (BSK Associates [BSK], 1993). Business activities include the manufacture of cast pipe and fittings. The facility accepts scrap iron and steel, which it stockpiles on-site, and uses during manufacturing activities. The Site encompasses an area of approximately 11.8 acres and contains various warehouses, manufacturing and office buildings. The entire Site is covered with buildings and asphalt/concrete pavement. Seven underground storage tanks (USTs) were previously located on the Site, including one 8,000-gallon UST used for storing unleaded gasoline, one 8,000-gallon UST used for the storage of mineral spirits and later 1,1,1-trichloroethane (1,1,1-TCA), one 550-gallon UST used for storing regular leaded gasoline, one 10,000-gallon UST used for storing diesel, and three 10,000-gallon USTs used for storing gasoline. All UST have been removed from the Site. UST removal activities were initiated in 1982 and completed in the early 1990s.

2.2 Hydrogeologic Setting

The Site is located near the San Francisco Bay within an area identified as the East Bay Plain. The East Bay Plain is situated on the east side of the San Francisco Bay depression. The alluvial sediments of the East Bay Plain consist of a mixture of gravel, sand and clay deposited by coalescing alluvial fans. In the vicinity of the Site, fluvial and near shore deposits have been mapped (Helley et. al., 1979). The fluvial deposits are described as unconsolidated, moderately sorted, fine sand and silt, with clayey silt and occasional thin beds of coarse sand (Muir, 1993). The near-shore deposits are described as a well-sorted, fine to medium grained sand and silt, with lenses of sandy clay and clay. Regional groundwater flow in the vicinity of the Site is interpreted to be towards the west - southwest toward San Leandro Bay.

The Site is underlain by a mixture of sandy/silty clay to a depth of at least 20-feet below ground surface (bgs). Groundwater has been encountered in borings and excavations at depths ranging from 3 to 8-feet bgs at the Site. Groundwater monitoring data from on-site monitoring wells generally flows to the northwest at a gradient of approximately 0.006 feet per foot (ft/ft); (SGI, 2009a).

2.3 Summary of Remedial Actions and Current Environmental Conditions

Initial site assessment activities began in 1991 as part of the facility's UST removal program. The USTs removed consisted of:

- three 10,000-gallon tanks used for storing gasoline (removed 1982/1983);
- one 550-gallon UST used for storing regular, leaded gasoline (removed 1991);
- one 8,000-gallon tank used for storing unleaded gasoline (removed 1991);
- one 8,000-gallon tank initially used for storing mineral spirits and later for storing 1,1,1-trichloroethane (removed 1991); and
- one 10,000-gallon tank used for storing diesel fuel (removed 1992).

Removal of the tanks, with the exception of the three 10,000-gallon gasoline USTs were provided in UST closure reports. The locations of the former USTs are identified on Figure 2.

In July/August 2006, a soil and groundwater assessment was conducted as part of a property transfer. The assessment consisted of sampling three existing monitoring wells (MW-1, MW-3, and MW-4); abandoning damaged well MW-2; and installing and sampling six new groundwater monitoring wells (MW-2R, and MW-5 through MW-9). Soil samples were collected at various depth intervals during the installation of monitoring wells MW-5, MW-6, MW-7, and MW-8. Results of the assessment were presented in the Preliminary Groundwater Investigation Report (BSK, 2007).

In response to a request from ACEH, additional soil, groundwater and soil vapor investigations were conducted in 2007, 2008, and 2009. These investigations included the investigation of shallow groundwater (less than 30 feet bgs) and deep groundwater (greater than 30 feet bgs), and the collection of soil vapor samples. The results of these investigations indicated that shallow groundwater in the vicinity of the Parking Lot Area (located in the vicinity and northwest of well MW-8; Figure 2) was impacted with chlorinated volatile organic compounds (VOCs), including 1,1,1-TCA, 1,1-dichloroethane (1,1-DCA), 1,1-dichloroethene (1,1-DCE), chloroethane, cis-and trans-1,2-dichloroethene (1,2-DCE), and vinyl chloride. Shallow groundwater in the vicinity of the former three 10,000 gallon USTs area (located in the vicinity of well MW-9) was impacted with petroleum fuels including benzene, toluene, ethylbenzene and xylenes (BTEX), total petroleum hydrocarbons as gasoline (TPHg), and total petroleum hydrocarbons as diesel (TPHd). Results of the soil vapor analysis indicated that isolated soil gas samples had indoor air vapor intrusion environmental screening level (ESL) exceedences for benzene, ethylbenzene, vinyl chloride and tetrachloroethene (PCE) under the commercial land use scenario. A site specific risk assessment was conducted and results concluded that the risks posed by soil vapors were acceptable with respect to indoor air exposure under the industrial land use scenario and did not require further action. Further details can be found in SGI's reports titled, "Site Investigation Report," "Additional Site Investigation Report," and "Supplemental Soil Vapor Investigation Report" (SGI 2008a; SGI,

2008b, and SGI, 2009b). ACEH concurred with the report conclusions in a letter dated May 20, 2009.

In order to address residual petroleum hydrocarbons and VOCs in groundwater, enhanced anaerobic biodegradation (EAnB) injections occurred in June 2009 at the Site beneath the parking lot area (near MW-3 and MW-8) and aerobic biodegradation (EAB) injections occurred near the former three 10,000 gallon USTs (near MW-9). Since that time, groundwater monitoring has occurred to track the progress of bioremediation in the subsurface.

Soil sample results associated with the 2007 investigations are summarized in Tables 1 and 2 and Figures 3 through 6. Soil gas sample results for the investigations conducted in 2007, 2008, and 2009 are presented in Figures 7 though 9. Groundwater sample results associated with the 2007 investigations are presented in Figures 10 and 11. Groundwater monitoring well sample results conducted during 2009 and 2010 are summarized in Tables 3 and 4 and groundwater monitoring well sample results conducted during July and December 2010 are presented in Figures 12 through 15.

3.0 SUMMARY OF HUMAN HEALTH RISKS

This section presents a summary of a screening level risk evaluation (SLRE) that was conducted by SGI for the Site. The SLRE included the development of a conceptual site model that was used to evaluate the potential sources, contaminant migration pathways, and potential receptors for the petroleum hydrocarbons and VOCs within the area of and downgradient of the former mineral spirits/1,1,1-TCA UST and former three 10,000-Gallon USTs dispenser island area. The results of the SLRE are summarized below.

3.1.1 Potential Sources

The potential source(s) of contaminants released into the environment are interpreted to be leaks associated with the operation of the former mineral spirits/1,1,1-TCA UST and the former three 10,000-Gallon gasoline USTs dispenser island area.

Previous investigations related to the former mineral spirits/1,1,1-TCA UST removal and subsequent groundwater sampling have identified the presence of 1,1,1-TCA, chloroethane, 1,1-DCA, 1,1-DCE, and vinyl chloride in soil and, or groundwater in the immediate vicinity and downgradient (northwest) of the former mineral spirits/1,1,1-TCA UST (Figure 11). In addition, releases of TPH from the former three 10,000-Gallon gasoline USTs dispenser island area also appear to be commingling with and have impacted groundwater in the area of the former mineral spirits/1,1,1-TCA UST (Figure 10).

Groundwater underlying and south-southwest of the former three 10,000-Gallon gasoline USTs dispenser island area is impacted with TPHg, BTEX, and TPHd. The highest concentrations of TPHg, BTEX, and TPHd were reported in samples collected from beneath the storage goods warehouse, which is located south-southwest of the tank area (Figure 10). Higher concentrations of TPHg, BTEX, and TPHd in groundwater samples collected downgradient of the UST area suggest that excavation of the source area during the removal of the USTs was effective in reducing the source of contaminants to groundwater in the immediate vicinity of the USTs. The presence of elevated concentrations of TPHg, BTEX, and TPHd in groundwater underlying the storage goods warehouse is interpreted to be related to residual petroleum hydrocarbons that have migrated via groundwater flow from the former UST area.

The migration of TPH and chlorinated VOCs at the Site is interpreted to occur as a result of shallow groundwater flow. However, natural processes such as adsorption, dispersion, and natural degradation are expected to limit the horizontal and vertical extent of TPH and chlorinated VOCs. The primary source of the contaminants, leaks associated with discharges of TPH and chlorinated VOCs from the UST systems, have been terminated. Therefore, the only remaining sources are interpreted to be the affected soil beneath and downgradient of the USTs. As previously described

in Section 1.1, the entire Site is covered with concrete or asphalt/concrete (A/C) pavement. Therefore, there is currently no direct access to the affected soil.

3.1.2 Contaminant Migration Pathways

TPH tends to sorb to soil particles and can be transported from surface soils at the Site via dust generation or in surface water runoff. VOCs detected at the Site (e.g., chlorinated solvents or gasoline-range petroleum hydrocarbons) would not be expected to be present in surface soils, but can migrate downward from shallow soils to deeper soils under the force of gravity. VOCs could also migrate upward in soil vapor to indoor or outside air. In addition, these types of chemicals can migrate to underlying groundwater through leaching. Dissolved chlorinated solvents and petroleum hydrocarbons can also migrate with groundwater flow.

3.1.3 Potential Receptors and Exposure Pathways

The Site and surrounding areas are currently zoned for commercial/industrial use and they are expected to remain as such in the future. Therefore, the following receptors include:

- Hypothetical On-Site Outdoor Commercial/Industrial Worker Receptor (current and future exposure scenario);
- Hypothetical On-Site Indoor Commercial/Industrial Worker Receptor (current and future exposure scenario), and;
- Hypothetical On-Site and Off-Site Outdoor Construction Worker Receptor (current and future exposure scenario).

The exposure pathways assumed to be complete and significant for the hypothetical On-Site outdoor commercial/industrial and On-Site and Off-Site construction worker receptors include:

- Ingestion of soil;
- Dermal contact with soil; and
- Inhalation of dusts/vapors in outdoor air generated from soil and groundwater.

4.0 SITE MANAGEMENT ACTIVITIES

4.1 General

No excavation work shall be conducted at the Site, unless expressly permitted in writing by the ACEH. Any contaminated soils brought to the surface by grading, excavation, trenching, or backfilling shall be managed by the Site or his agent in accordance with all applicable provisions of local, state and federal law. Notwithstanding the foregoing, the Site may perform routine landscaping and maintenance of improvements thereon.

All uses and development shall preserve the integrity of any cap, any remedial measures taken or remedial equipment installed, and any groundwater monitoring system installed on the Site pursuant to the requirements of the ACEH, unless otherwise expressly permitted in writing by the ACEH. No additional buildings or other subsurface structures are to be constructed without the approval of ACEH.

With the exception of the existing onsite water supply well, no Owners or Occupants of the Site or any portion thereof shall drill, bore, otherwise construct, or use a well for the purpose of extracting water for any use, including but not limited to, domestic, potable, or industrial uses, unless expressly permitted in writing by the ACEH.

The Site shall notify the ACEH of each of the following: (1) The type, cause, location and date of any disturbance to any cap, any remedial measures taken or remedial equipment installed, and of the groundwater monitoring system installed on the Site pursuant to the requirements of the ACEH, which could affect the ability of such cap or remedial measures, remedial equipment, or monitoring system to perform their respective functions and (2) the type and date of repair of such disturbance. Notification to the ACEH shall be made by registered mail within ten (10) working days of both the discovery of such disturbance and the completion of repairs.

4.2 Soil Management

Soil management during construction addresses precautions that will be taken to mitigate risks to human health and the environment from identified chemicals during future redevelopment and/or intrusive activities at the Site such as soil excavation, trenching, new construction, site development, grading and utility repair. These precautions will include the following:

- Implementation of construction impact mitigation measures, including control of dust generation at the Site, decontamination of equipment, and prevention of storm water runoff; and

- Establishment of procedures to: (1) manage soil and groundwater on the Site during construction and (2) characterize soil if it is found to contain concentrations of TPH, VOCs , or metals in excess of State of California hazardous waste criteria or ESLs for commercial land use.

4.3 Site Specific Health and Safety Plans

During all activities involving disturbance of the surface cap or subsurface excavation, those workers that may directly contact soil or groundwater containing constituents of concern (VOCs, petroleum hydrocarbons, and metals) will perform these activities in accordance with a site-specific health and safety plan. The plan will be consistent with State and Federal Occupational Safety and Health Administration ("OSHA") standards for hazardous waste operations (CCR, Title 8, Section 5192 and 29 Code of Federal Regulations 1910.120, respectively). Among other things, the health and safety plan will include a description of health and safety training requirements for onsite construction workers, a description of the level of personal protective equipment to be used, if any, air quality monitoring plans, and any other applicable precautions to be undertaken. The health and safety Plan shall include procedures for handling soil and/or groundwater contaminated with VOCs, petroleum hydrocarbons, and/or metals.

4.4 Soil Management Protocols

Soil management protocols described in this section provide guidance for excavating and handling soil at the Site. The specific protocols to be followed when managing soil on the Site are summarized below:

- If soil is to be disposed offsite then sampling frequencies and test methods employed to characterize the soil will be determined by the disposal facility accepting the soil.
- If soil is to remain at the Site it must be tested to determine if TPH, VOCS, and metals are less than the appropriate screening levels for reuse.
- Testing of soil for reuse can be performed: (1) in advance of excavation by collecting soil samples from soil borings installed to the depth of the intended excavation or (2) during excavation by sampling excavated soil as stockpiles are being formed.

4.4.1 Soil Testing and Analytical Protocol

Soil intended for reuse will be sampled at an appropriate frequency in accordance with the Department of Toxic Substances Control (DTSCs) Information Advisory Clean Imported Fill Material (Advisory), dated October 2001 (DTSC 2001). A sampling grid will be established for each stockpile based on the volume of soil and minimum number of samples to be collected in accordance with DTSC's Advisory as follows:

- Stockpiles up to 1,000 cubic yards: 1 sample per 250 cubic yards.
- Stockpiles from 1,000 to 5,000 cubic yards: 4 samples for first 1000 cubic yards plus 1 sample per each additional 500 cubic yards.
- Stockpiles greater than 5,000 cubic yards: 12 samples for first 5,000 cubic yards plus 1 sample per each additional 1,000 cubic yards.

Stockpile samples will be collected by removing the surface soil (approximately 6-inches) followed by inserting a brass or stainless steel tube into the soil. Each sample container will be labeled, sealed, and placed on ice in a cooler. Samples will be transmitted under chain-of-custody procedures to a State of California certified laboratory. Soil samples will be analyzed for TPH, VOCs, and metals using EPA Methods 8015M, 8260B, and 6010. Soil samples that exceed ten times their respective soluble threshold limit concentration (STLC; metals) will also be analyzed using the waste extraction test (WET) to further assess the re-use of soil onsite. Soil that exceeds the STLC or commercial ESL will be disposed of offsite at an appropriate disposal facility.

Additional soil samples may also be collected from the stockpiled soil to aid in disposal. Soil samples in stockpiles will be collected at a frequency that is required by the disposal facility (landfill). Samples will be analyzed for additional analytes as required for disposal.

4.4.2 Handling Procedures for Contaminated Soil

The following handling procedures shall be followed during excavation activities.

- Any stockpiled soil shall be covered with plastic sheeting or tarps and will not be stockpiled in or near storm drains.
- Access to excavated areas shall be controlled to prevent unauthorized persons accessing exposed soil.
- Soil determined to be hazardous waste shall be disposed of offsite. Soil shall be transported under applicable U.S. and California Department of Transportation regulations. Current federal and state requirements should be reviewed prior to disposal of soil.

4.5 Handling Procedures for Contaminated Groundwater

VOCs and TPH at levels above ESLs have been detected in groundwater samples from the Site. Therefore, if any excavation activities require dewatering, water shall be stored in holding tanks and sampled in accordance with applicable laws and regulations for disposal.

Any project-related water associated with dewatering activities shall either discharge into the sanitary sewer, under permit with East Bay Municipal Utility District (EBMUD), or comply with the National Pollutant Discharge System (NPDES) permit regulations and an associated Storm Water

Pollution Prevention Plan (SWPPP) regarding discharge into storm drains. Such permit requirements typically include on-site treatment to remove pollutants prior to discharge. Alternatively, the water shall be temporarily stored onsite in holding tanks, pending off-site disposal at an approved disposal facility.

4.6 Minimizing Soil and Groundwater Contact by Construction Workers

There are potential health and safety risks associated with the petroleum hydrocarbons, VOCs, and metals detected in Site soils, as well as petroleum hydrocarbons and VOCs detected in groundwater. There is the potential for contact by construction workers with residual chemicals in soil at the Site. The routes of potential exposure to the petroleum hydrocarbons, VOCs, and metals in soil are: dermal (skin) contact with the soil; (2) inhalation of dusts; and (3) ingestion of the soil.

Groundwater occurs on-Site at a depth of 3 to 8 feet bgs. There is the potential for contact by construction workers with residual chemicals in groundwater at the Site. The routes of potential exposure to the petroleum hydrocarbons and VOCs in groundwater are: (1) dermal (skin) contact with groundwater; and (2) inhalation of emissions from exposed water. The greatest potential for human exposure to the petroleum hydrocarbons and VOCs in water will be during soil excavation operations and dewatering activities.

The abovementioned health risks to on-Site construction workers will be minimized by developing and implementing a site-specific health and safety plan. The Site Environmental Manager or representative overseeing removal actions will be responsible for establishing and maintaining proper health and safety procedures to minimize construction worker exposure to Site contaminants. At minimum, the site-specific health and safety plan will include: (1) health and safety training requirements for on-Site personnel; (2) personal hygiene and monitoring equipment to be used during construction to protect and verify the health and safety of the construction workers; (3) additional precautions to be undertaken to minimize direct contact with hazardous substances, including implementation of dust control measures; and (4) a description of the procedures to mitigate any potential health risk to bystanders during subsurface activities.

A Site health and safety officer (HSO) or designee will be on-Site during excavation activities to ensure that all health and safety measures are maintained. The HSO will have the authority to direct and, if necessary, stop all construction activities in order to ensure compliance with the site-specific health and safety plan.

4.7 Site Control

Access to the work zones where soil will be disturbed shall be controlled using caution tape, cones, fencing, steel plates, or other measures to clearly designate the active work area and to prevent access by the public. To minimize the migration of contaminated soils from the Site to

uncontaminated areas, excavated soil shall be covered and secured by temporary fences or other means to prevent unauthorized access.

4.8 Dust/Vapor Control Measures

Dust control measures will be implemented during construction activities at the Site to minimize the generation of dust. Dust generation that will be mitigated includes that associated with excavation activities, truck traffic, ambient wind traversing soil stockpiles, and loading of transportation vehicles.

Dust generation will be minimized using appropriate measures. These measures include but are not limited to the following:

- Mist or spray water while performing excavation activities and loading transportation vehicles;
- Limit vehicle speeds on the property to 5 miles per hour;
- Control excavation activities to minimize the generation of dust;
- Minimize drop heights while loading transportation vehicles; and
- Cover soil stockpiles, if present, with visqueen or tarps.

If the construction area is greater than 4 acres, use enhanced control measures as specified in Table 2 of the BAAQMD California Environmental Quality Act Guidelines (BAAQMD, 1999).

4.9 Decontamination

Decontamination procedures shall be developed by contractors to minimize the equipment contamination during excavation activities. The procedures should include removing loose soil from the vehicle exterior using dry methods, such as brushing, scraping or vacuuming. Soil not removed by dry methods, should be cleaned by pressure washing or steam cleaning. Water collected from the cleaning process should be sampled prior to disposal.

4.10 Monitoring Wells

All groundwater monitoring wells located onsite shall be protected during excavation and construction activities. A map showing the locations of wells currently on the property are shown on Figure 2. Any damage to these wells should be reported immediately. All the wells should be accessible to others during excavation and construction activities. Prior to removal or relocation of any wells, the ACEH shall be notified and well destruction or installation permits shall be obtained from Alameda County Department of Public Works.

4.11 Storm Water Control

Storm water pollution controls shall be implemented by construction contractors to minimize sediment runoff in storm water, which could include soil containing contaminants of concern. Prior to the initiation of the work, the contractors must follow the requirements of the CRWQCB general permit and other permits by the CRWQCB. Storm water pollution controls implemented at the Site will be based on best management practices, such as those described in the "Information on Erosion and Sediment Controls for Construction Projects: A Guidebook," Erosion and Sediment Control Field Manual (CRWQCB, 2002), and the Storm Water Best Management Practices Handbook (CSQA, 2003).

Procedures to prevent erosion and sediment runoff from the Site shall include grading the Site, installing storm water control devices such as temporary earth berms or erecting silt fences around the perimeter of exposed soil at the Site. Straw bale barriers or sediment traps are required to protect the existing catch basins.

4.12 Reporting

After earthwork activities are complete, a report will be prepared to document the relocation and final disposition of soil reused or disposed of offsite. At a minimum, the report will include the dimensions of the excavation and confirmation sample locations. The analytical data will be provided in tables and a Site plan showing sampling locations and limits of excavation and grading will be presented. If applicable, copies of receipts pertaining to the disposition of the soil will be appended to the report.

5.0 CONTINGENCY PLAN

The following contingency plan shall be implemented to address unknown contamination during grading, trenching, and dewatering activities:

- All grading, trench excavation and filling operations, and dewatering operations shall be observed for the presence of free-phase petroleum products, chemicals, or contaminated soil/groundwater. Discolored soil or suspected contaminated soil shall be segregated from clean soil. In the event unexpected, contaminated soil or groundwater is encountered during construction, the contractor shall notify Site Environmental Manager. The Site Environmental Manager shall confirm the presence of the suspect material and direct the contractor to remove, stockpile or contain, and characterize the suspect material(s) identified within the boundaries of the construction area. Continued work at a contaminated site shall require the approval of the Site Environmental Manager.
- A photoionization detector (or other organic vapor detecting device) shall be present during grading and excavation through suspected chemically impacted soil.
- Excavation of VOC-impacted soil will require obtaining and complying with a Bay Area Air Quality Management District Rule 40 permit.
- The extent of removal actions shall be determined on a site-specific basis. At a minimum, the chemically impacted area(s) within the boundary of the construction area and/or trench shall be remediated to the satisfaction of the lead regulatory agency (ACEH) for the site. The Site Environmental Manager or representative overseeing removal actions shall inform the contractor when the removal action is complete.
- In the event that contaminated soil is encountered, all on-site personnel handling or working in the vicinity of the contaminated material shall be trained in accordance with OSHA regulations for hazardous waste operations. These regulations are based on CFR 1910.120 (e) and 8 CCR 5192, which states that "general site workers" shall receive a minimum of 40 hours of classroom training and a minimum of three days of field training. This training provides precautions and protective measures to reduce or eliminate hazardous materials/waste hazards at the work place.
- All excavations shall be filled with structurally suitable fill material which contains non-hazardous contaminant concentrations (if any) that do not exceed ESLs. The cover (cap) shall be repaired and returned to its pre-excavation condition.
- Any project-related dewatering activities shall either discharge into the sanitary sewer, under permit with the EBMUD, or comply with the NPDES permit regulations and an associated SWPPP regarding discharge into storm drains. Such permit requirements typically include on-site treatment to remove pollutants prior to discharge. Alternatively, the

water shall be temporarily stored onsite in holding tanks, pending off-site disposal at an approved disposal facility.

- The Site Environmental Manager shall confirm the presence of the suspect contaminated soil and direct the contractor to remove, stockpile, or contain the suspect material identified within the boundaries of the construction area. Contaminated soil shall either be treated on-site or trucked off-site for disposal at a California licensed facility approved for disposal of such waste.
- After earthwork activities are complete, a report will be prepared to document the relocation and final disposition of soil reused or disposed of offsite. At a minimum, the report will include the dimensions of the excavation and confirmation sample locations. The analytical data will be provided in tables and a Site plan showing sampling locations and limits of excavation and grading will be presented. If applicable, copies of receipts pertaining to the disposition of the soil will be appended to the report.

5.1 Implementation of Site Management Plan

AB&I shall oversee implementation of this SMP at the Site. A copy of this SMP shall be included in all contracts signed with contractors and third party contractors working in the subsurface at the Site. It is the responsibility of the contractor to adhere to this SMP, project specifications, and site safety. The contractor is also responsible for providing a copy of this SMP to its subcontractors.

This SMP was developed based on the current conditions at the Site and applicable regulations. It may be necessary to modify this SMP from time to time for any of several reasons, including the following.

- Change in property use (e.g., addition of buildings to the site);
- Any change in legal requirements;
- Change in environmental conditions;
- Intrusive activity that is not addressed by this SMP; and
- New chemical toxicity information for chemicals present at the Site.

5.2 Limitations

This SMP was prepared to address VOCs, TPH and metals present in the soil and groundwater at the Site and current known site conditions, regulations and laws. This SMP does not address issues related to other chemicals or future site conditions that may be encountered during construction projects, including but not limited to, demolition and construction debris, asphalt, concrete, and asbestos-containing materials. If such materials are encountered during a

construction project, contractors and workers are responsible for complying with all applicable laws pertaining to the handling and disposal of these materials.

The Site-related activities may be subject to federal, state, and local laws and regulations, including those published by U.S. Environmental protection Agency (USEPA), the BAAQMD, California Environmental Protection Agency (Cal-EPA), Alameda County, and the City of Oakland. These regulations address issues such as health and safety, hazardous waste, dust generation, storm water, and community right-to-know. It is the responsibility of the parties involved to ensure that all construction and maintenance activities abide by current applicable laws and regulations.

SGI disclaims any responsibility for any unauthorized use of this SMP. It is understood that while this SMP is intended to provide guidance and establish a framework for the management of residual product in the subsurface in soil to protect human health and the environment, this SMP shall not create any warranties or obligations to AB&I as to implementation, adequacy, or success of protective measures under this SMP.

Notes:

MTBE - Methyl ten butyl ether
(mg/kg) - milligrams per kilogram
TPHg - Total Petroleum Hydrocarbons as Gasoline
TPHd - Total Petroleum Hydrocarbons as Diesel
<0.005 - Not reported at or above laboratory's reporting limit of 0.005 mg/kg
UST - underground storage tank
1,1,1-TCA - 1,1,1-Trichloroethane

-TPHg, BTEX, VOCs and fuel oxygenates analyzed using EPA Method 8260B by Test America Laboratories (TAL), Pleasanton, California

-TPHd analyzed using EPA Method 8015M with silica gel cleanup by TAL, Pleasanton, California

RWQCB ESLs - Environmental Screening Levels taken from the California Regional Water Quality Control Board, San Francisco Bay Region document entitled "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater," Interim Final November 2007, groundwater is not a current or potential source of drinking water.

-Concentrations in bold exceed commercial ESLs for shallow soil (less than 3 meters).

Notes:
Value in bold exceed the MCL.
Shaded values exceed the ESL for vapor intrusion
[1] California Department of Health Drinking Water Program, Drinking Water Notification Level, December 14, 2007

MCL	=	California EPA Department of Health Service Maximum concentration levels for drinking water
RWQCB ESLs (VI)	=	Regional Water Quality Control Board Environmental Screening Levels based on vapor intrusion concerns for commercial land use scenario.
ug/L	=	All concentrations reported in micrograms per liter (ug/L).
TPH	=	Total Petroleum Hydrocarbons
MTBE	=	methyl tert butyl ether
ETBE	=	ethyl tert butyl ether
TAME	=	tert-amyl methyl ether
DIPE	=	diisopropyl ether
TBA	=	tributyl alcohol
DCA	=	dichloroethane
ND	=	Not detected at or above laboratory reporting limit.
<50	=	Not detected at or above laboratory reporting limit of 50 ug/L.
NS	=	Not sampled.
--	=	Not analyzed.
*500	=	Reported due to the presence of discrete peaks
J	=	analyte detected below quantitation limits

Subject: Fuel Leak Case No. RO0000092 and Geotracker Global ID T0600100065 Revised Site Management Plan, AB&I Foundry, 7825 San Leandro Street, Oakland California 94621

Dear Mr. Wickham:

AB&I respectfully submits the attached Revised Site Management Plan for the AB&I Foundry Site located at 7825 San Leandro Street, Oakland, California.

I declare, under penalty of perjury, that the information and/or recommendations contained in the attached document are true and correct to the best of my knowledge.

Sincerely,

Dave Robinson
Engineering Manager

CERTIFICATION

All hydrogeologic and geologic information in this document regarding the AB&I Foundry Site have been prepared under the supervision of and reviewed by the certified professional whose signature appears below.

Andrew Zdon, P.G., C.HG.
Principal Hydrogeologist
The Source Group, Inc.

1.0 INTRODUCTION

On behalf of AB&I Foundry (AB&I), The Source Group, Inc. (SGI) has prepared this Revised Site Management Plan (SMP) for the AB&I Site located at 7825 San Leandro Street in Oakland, California (Figure 1; Site).

This SMP has been prepared in response to a letter submitted to AB&I by Alameda County Environmental Health (ACEH) dated April 28, 2011 (ACEH, 2011a). The ACEH April 28, 2011 letter requests that "*In order to prevent potential future exposure to residual contamination and move the site towards case closure, we request that you now submit a draft Covenant and Environmental Restriction on Property (Deed Restriction) along with a Site Management Plan (SMP)*."

An administrative control in the form of a deed restriction will be implemented as part of the case closure. The deed restriction has been prepared under separate cover and specifies that the Site will be limited in development for industrial use. Article III, section 3.1, part f of the deed restriction states:

No Owners or Occupants of the Property or any portion thereof shall conduct any excavation work on the Property, unless expressly permitted in writing by the County. Any contaminated soils brought to the surface by grading, excavation, trenching, or backfilling shall be managed by Covenantor or his agent in accordance with all applicable provisions of local, state and federal law. Notwithstanding the foregoing, Covenantor may perform routine landscaping and maintenance of surface improvements thereon.

Consistent with the deed restriction, this SMP provides a framework to manage residual chemicals in soil at the Site in a manner that is: (1) satisfactory to ACEH and other regulatory agencies, (2) protective of human health and the environment, and (3) consistent with current land uses.

This Revised SMP replaces the Revised SMP dated June 15, 2011. The Revised SMP incorporates comments provided by ACEH in their letter dated June 8, 2011 (ACEH, 2011b) and subsequent verbal comments provided on July 12, 2011.

1.1 Site Location and Description

The Site is located at 7825 San Leandro Street, east of the intersection with 77th Avenue, in a light industrial area of Oakland (Figures 1 and 2). The Site is bounded by commercial/industrial properties to the north, south, east, and west. Union Pacific Railroad is located immediately adjacent to and west of the Site. Oakland Truck Stop is located immediately adjacent to and east of the Site. Elmhurst Creek is located along the southeast corner of the property (Figure 2). San

Leandro Bay is located approximately one mile west of the Site. The entire Site is covered with concrete and asphalt/concrete pavement.

1.2 Purpose and Objectives

The purpose of this SMP is to provide a plan to prevent or minimize human exposure to soil and groundwater contamination at the Site. This SMP was prepared to govern all future redevelopment and/or intrusive work at the Site such as soil excavation, trenching and backfilling activities.

2.0 BACKGROUND

This section provides information about subsurface conditions and remediation activities at the Site.

2.1 Site Operational History

AB&I have been operating at the Site location since at least 1930 (BSK Associates [BSK], 1993). Business activities include the manufacture of cast pipe and fittings. The facility accepts scrap iron and steel, which it stockpiles on-site, and uses during manufacturing activities. The Site encompasses an area of approximately 11.8 acres and contains various warehouses, manufacturing and office buildings. The entire Site is covered with buildings and asphalt/concrete pavement. Seven underground storage tanks (USTs) were previously located on the Site, including one 8,000-gallon UST used for storing unleaded gasoline, one 8,000-gallon UST used for the storage of mineral spirits and later 1,1,1-trichloroethane (1,1,1-TCA), one 550-gallon UST used for storing regular leaded gasoline, one 10,000-gallon UST used for storing diesel, and three 10,000-gallon USTs used for storing gasoline. All UST have been removed from the Site. UST removal activities were initiated in 1982 and completed in the early 1990s.

2.2 Hydrogeologic Setting

The Site is located near the San Francisco Bay within an area identified as the East Bay Plain. The East Bay Plain is situated on the east side of the San Francisco Bay depression. The alluvial sediments of the East Bay Plain consist of a mixture of gravel, sand and clay deposited by coalescing alluvial fans. In the vicinity of the Site, fluvial and near shore deposits have been mapped (Helley et. al., 1979). The fluvial deposits are described as unconsolidated, moderately sorted, fine sand and silt, with clayey silt and occasional thin beds of coarse sand (Muir, 1993). The near-shore deposits are described as a well-sorted, fine to medium grained sand and silt, with lenses of sandy clay and clay. Regional groundwater flow in the vicinity of the Site is interpreted to be towards the west - southwest toward San Leandro Bay.

The Site is underlain by a mixture of sandy/silty clay to a depth of at least 20-feet below ground surface (bgs). Groundwater has been encountered in borings and excavations at depths ranging from 3 to 8-feet bgs at the Site. Groundwater monitoring data from on-site monitoring wells generally flows to the northwest at a gradient of approximately 0.006 feet per foot (ft/ft); (SGI, 2009a).

2.3 Summary of Remedial Actions and Current Environmental Conditions

Initial site assessment activities began in 1991 as part of the facility's UST removal program. The USTs removed consisted of:

- three 10,000-gallon tanks used for storing gasoline (removed 1982/1983);
- one 550-gallon UST used for storing regular, leaded gasoline (removed 1991);
- one 8,000-gallon tank used for storing unleaded gasoline (removed 1991);
- one 8,000-gallon tank initially used for storing mineral spirits and later for storing 1,1,1-trichloroethane (removed 1991); and
- one 10,000-gallon tank used for storing diesel fuel (removed 1992).

Removal of the tanks, with the exception of the three 10,000-gallon gasoline USTs were provided in UST closure reports. The locations of the former USTs are identified on Figure 2.

In July/August 2006, a soil and groundwater assessment was conducted as part of a property transfer. The assessment consisted of sampling three existing monitoring wells (MW-1, MW-3, and MW-4); abandoning damaged well MW-2; and installing and sampling six new groundwater monitoring wells (MW-2R, and MW-5 through MW-9). Soil samples were collected at various depth intervals during the installation of monitoring wells MW-5, MW-6, MW-7, and MW-8. Results of the assessment were presented in the Preliminary Groundwater Investigation Report (BSK, 2007).

In response to a request from ACEH, additional soil, groundwater and soil vapor investigations were conducted in 2007, 2008, and 2009. These investigations included the investigation of shallow groundwater (less than 30 feet bgs) and deep groundwater (greater than 30 feet bgs), and the collection of soil vapor samples. The results of these investigations indicated that shallow groundwater in the vicinity of the Parking Lot Area (located in the vicinity and northwest of well MW-8; Figure 2) was impacted with chlorinated volatile organic compounds (VOCs), including 1,1,1-TCA, 1,1-dichloroethane (1,1-DCA), 1,1-dichloroethene (1,1-DCE), chloroethane, cis-and trans-1,2-dichloroethene (1,2-DCE), and vinyl chloride. Shallow groundwater in the vicinity of the former three 10,000 gallon USTs area (located in the vicinity of well MW-9) was impacted with petroleum fuels including benzene, toluene, ethylbenzene and xylenes (BTEX), total petroleum hydrocarbons as gasoline (TPHg), and total petroleum hydrocarbons as diesel (TPHd). Results of the soil vapor analysis indicated that isolated soil gas samples had indoor air vapor intrusion environmental screening level (ESL) exceedences for benzene, ethylbenzene, vinyl chloride and tetrachloroethene (PCE) under the commercial land use scenario. A site specific risk assessment was conducted and results concluded that the risks posed by soil vapors were acceptable with respect to indoor air exposure under the industrial land use scenario and did not require further action. Further details can be found in SGI's reports titled, "Site Investigation Report," "Additional Site Investigation Report," and "Supplemental Soil Vapor Investigation Report" (SGI 2008a; SGI,

2008b, and SGI, 2009b). ACEH concurred with the report conclusions in a letter dated May 20, 2009.

In order to address residual petroleum hydrocarbons and VOCs in groundwater, enhanced anaerobic biodegradation (EAnB) injections occurred in June 2009 at the Site beneath the parking lot area (near MW-3 and MW-8) and aerobic biodegradation (EAB) injections occurred near the former three 10,000 gallon USTs (near MW-9). Since that time, groundwater monitoring has occurred to track the progress of bioremediation in the subsurface.

Soil sample results associated with the 2007 investigations are summarized in Tables 1 and 2 and Figures 3 through 6. Soil gas sample results for the investigations conducted in 2007, 2008, and 2009 are presented in Figures 7 though 9. Groundwater sample results associated with the 2007 investigations are presented in Figures 10 and 11. Groundwater monitoring well sample results conducted during 2009 and 2010 are summarized in Tables 3 and 4 and groundwater monitoring well sample results conducted during July and December 2010 are presented in Figures 12 through 15.

3.0 SUMMARY OF HUMAN HEALTH RISKS

This section presents a summary of a screening level risk evaluation (SLRE) that was conducted by SGI for the Site. The SLRE included the development of a conceptual site model that was used to evaluate the potential sources, contaminant migration pathways, and potential receptors for the petroleum hydrocarbons and VOCs within the area of and downgradient of the former mineral spirits/1,1,1-TCA UST and former three 10,000-Gallon USTs dispenser island area. The results of the SLRE are summarized below.

3.1.1 Potential Sources

The potential source(s) of contaminants released into the environment are interpreted to be leaks associated with the operation of the former mineral spirits/1,1,1-TCA UST and the former three 10,000-Gallon gasoline USTs dispenser island area.

Previous investigations related to the former mineral spirits/1,1,1-TCA UST removal and subsequent groundwater sampling have identified the presence of 1,1,1-TCA, chloroethane, 1,1-DCA, 1,1-DCE, and vinyl chloride in soil and, or groundwater in the immediate vicinity and downgradient (northwest) of the former mineral spirits/1,1,1-TCA UST (Figure 11). In addition, releases of TPH from the former three 10,000-Gallon gasoline USTs dispenser island area also appear to be commingling with and have impacted groundwater in the area of the former mineral spirits/1,1,1-TCA UST (Figure 10).

Groundwater underlying and south-southwest of the former three 10,000-Gallon gasoline USTs dispenser island area is impacted with TPHg, BTEX, and TPHd. The highest concentrations of TPHg, BTEX, and TPHd were reported in samples collected from beneath the storage goods warehouse, which is located south-southwest of the tank area (Figure 10). Higher concentrations of TPHg, BTEX, and TPHd in groundwater samples collected downgradient of the UST area suggest that excavation of the source area during the removal of the USTs was effective in reducing the source of contaminants to groundwater in the immediate vicinity of the USTs. The presence of elevated concentrations of TPHg, BTEX, and TPHd in groundwater underlying the storage goods warehouse is interpreted to be related to residual petroleum hydrocarbons that have migrated via groundwater flow from the former UST area.

The migration of TPH and chlorinated VOCs at the Site is interpreted to occur as a result of shallow groundwater flow. However, natural processes such as adsorption, dispersion, and natural degradation are expected to limit the horizontal and vertical extent of TPH and chlorinated VOCs. The primary source of the contaminants, leaks associated with discharges of TPH and chlorinated VOCs from the UST systems, have been terminated. Therefore, the only remaining sources are interpreted to be the affected soil beneath and downgradient of the USTs. As previously described

in Section 1.1, the entire Site is covered with concrete or asphalt/concrete (A/C) pavement. Therefore, there is currently no direct access to the affected soil.

3.1.2 Contaminant Migration Pathways

TPH tends to sorb to soil particles and can be transported from surface soils at the Site via dust generation or in surface water runoff. VOCs detected at the Site (e.g., chlorinated solvents or gasoline-range petroleum hydrocarbons) would not be expected to be present in surface soils, but can migrate downward from shallow soils to deeper soils under the force of gravity. VOCs could also migrate upward in soil vapor to indoor or outside air. In addition, these types of chemicals can migrate to underlying groundwater through leaching. Dissolved chlorinated solvents and petroleum hydrocarbons can also migrate with groundwater flow.

3.1.3 Potential Receptors and Exposure Pathways

The Site and surrounding areas are currently zoned for commercial/industrial use and they are expected to remain as such in the future. Therefore, the following receptors include:

- Hypothetical On-Site Outdoor Commercial/Industrial Worker Receptor (current and future exposure scenario);
- Hypothetical On-Site Indoor Commercial/Industrial Worker Receptor (current and future exposure scenario), and;
- Hypothetical On-Site and Off-Site Outdoor Construction Worker Receptor (current and future exposure scenario).

The exposure pathways assumed to be complete and significant for the hypothetical On-Site outdoor commercial/industrial and On-Site and Off-Site construction worker receptors include:

- Ingestion of soil;
- Dermal contact with soil; and
- Inhalation of dusts/vapors in outdoor air generated from soil and groundwater.

4.0 SITE MANAGEMENT ACTIVITIES

4.1 General

No excavation work shall be conducted at the Site, unless expressly permitted in writing by the ACEH. Any contaminated soils brought to the surface by grading, excavation, trenching, or backfilling shall be managed by the Site or his agent in accordance with all applicable provisions of local, state and federal law. Notwithstanding the foregoing, the Site may perform routine landscaping and maintenance of improvements thereon.

All uses and development shall preserve the integrity of any cap, any remedial measures taken or remedial equipment installed, and any groundwater monitoring system installed on the Site pursuant to the requirements of the ACEH, unless otherwise expressly permitted in writing by the ACEH. No additional buildings or other subsurface structures are to be constructed without the approval of ACEH.

With the exception of the existing onsite water supply well, no Owners or Occupants of the Site or any portion thereof shall drill, bore, otherwise construct, or use a well for the purpose of extracting water for any use, including but not limited to, domestic, potable, or industrial uses, unless expressly permitted in writing by the ACEH.

The Site shall notify the ACEH of each of the following: (1) The type, cause, location and date of any disturbance to any cap, any remedial measures taken or remedial equipment installed, and of the groundwater monitoring system installed on the Site pursuant to the requirements of the ACEH, which could affect the ability of such cap or remedial measures, remedial equipment, or monitoring system to perform their respective functions and (2) the type and date of repair of such disturbance. Notification to the ACEH shall be made by registered mail within ten (10) working days of both the discovery of such disturbance and the completion of repairs.

4.2 Soil Management

Soil management during construction addresses precautions that will be taken to mitigate risks to human health and the environment from identified chemicals during future redevelopment and/or intrusive activities at the Site such as soil excavation, trenching, new construction, site development, grading and utility repair. These precautions will include the following:

- Implementation of construction impact mitigation measures, including control of dust generation at the Site, decontamination of equipment, and prevention of storm water runoff; and

- Establishment of procedures to: (1) manage soil and groundwater on the Site during construction and (2) characterize soil if it is found to contain concentrations of TPH, VOCs , or metals in excess of State of California hazardous waste criteria or ESLs for commercial land use.

4.3 Site Specific Health and Safety Plans

During all activities involving disturbance of the surface cap or subsurface excavation, those workers that may directly contact soil or groundwater containing constituents of concern (VOCs, petroleum hydrocarbons, and metals) will perform these activities in accordance with a site-specific health and safety plan. The plan will be consistent with State and Federal Occupational Safety and Health Administration ("OSHA") standards for hazardous waste operations (CCR, Title 8, Section 5192 and 29 Code of Federal Regulations 1910.120, respectively). Among other things, the health and safety plan will include a description of health and safety training requirements for onsite construction workers, a description of the level of personal protective equipment to be used, if any, air quality monitoring plans, and any other applicable precautions to be undertaken. The health and safety Plan shall include procedures for handling soil and/or groundwater contaminated with VOCs, petroleum hydrocarbons, and/or metals.

4.4 Soil Management Protocols

Soil management protocols described in this section provide guidance for excavating and handling soil at the Site. The specific protocols to be followed when managing soil on the Site are summarized below:

- If soil is to be disposed offsite then sampling frequencies and test methods employed to characterize the soil will be determined by the disposal facility accepting the soil.
- If soil is to remain at the Site it must be tested to determine if TPH, VOCS, and metals are less than the appropriate screening levels for reuse.
- Testing of soil for reuse can be performed: (1) in advance of excavation by collecting soil samples from soil borings installed to the depth of the intended excavation or (2) during excavation by sampling excavated soil as stockpiles are being formed.

4.4.1 Soil Testing and Analytical Protocol

Soil intended for reuse will be sampled at an appropriate frequency in accordance with the Department of Toxic Substances Control (DTSCs) Information Advisory Clean Imported Fill Material (Advisory), dated October 2001 (DTSC 2001). A sampling grid will be established for each stockpile based on the volume of soil and minimum number of samples to be collected in accordance with DTSC's Advisory as follows:

- Stockpiles up to 1,000 cubic yards: 1 sample per 250 cubic yards.
- Stockpiles from 1,000 to 5,000 cubic yards: 4 samples for first 1000 cubic yards plus 1 sample per each additional 500 cubic yards.
- Stockpiles greater than 5,000 cubic yards: 12 samples for first 5,000 cubic yards plus 1 sample per each additional 1,000 cubic yards.

Stockpile samples will be collected by removing the surface soil (approximately 6-inches) followed by inserting a brass or stainless steel tube into the soil. Each sample container will be labeled, sealed, and placed on ice in a cooler. Samples will be transmitted under chain-of-custody procedures to a State of California certified laboratory. Soil samples will be analyzed for TPH, VOCs, and metals using EPA Methods 8015M, 8260B, and 6010. Soil samples that exceed ten times their respective soluble threshold limit concentration (STLC; metals) will also be analyzed using the waste extraction test (WET) to further assess the re-use of soil onsite. Soil that exceeds the STLC or commercial ESL will be disposed of offsite at an appropriate disposal facility.

Additional soil samples may also be collected from the stockpiled soil to aid in disposal. Soil samples in stockpiles will be collected at a frequency that is required by the disposal facility (landfill). Samples will be analyzed for additional analytes as required for disposal.

4.4.2 Handling Procedures for Contaminated Soil

The following handling procedures shall be followed during excavation activities.

- Any stockpiled soil shall be covered with plastic sheeting or tarps and will not be stockpiled in or near storm drains.
- Access to excavated areas shall be controlled to prevent unauthorized persons accessing exposed soil.
- Soil determined to be hazardous waste shall be disposed of offsite. Soil shall be transported under applicable U.S. and California Department of Transportation regulations. Current federal and state requirements should be reviewed prior to disposal of soil.

4.5 Handling Procedures for Contaminated Groundwater

VOCs and TPH at levels above ESLs have been detected in groundwater samples from the Site. Therefore, if any excavation activities require dewatering, water shall be stored in holding tanks and sampled in accordance with applicable laws and regulations for disposal.

Any project-related water associated with dewatering activities shall either discharge into the sanitary sewer, under permit with East Bay Municipal Utility District (EBMUD), or comply with the National Pollutant Discharge System (NPDES) permit regulations and an associated Storm Water

Pollution Prevention Plan (SWPPP) regarding discharge into storm drains. Such permit requirements typically include on-site treatment to remove pollutants prior to discharge. Alternatively, the water shall be temporarily stored onsite in holding tanks, pending off-site disposal at an approved disposal facility.

4.6 Minimizing Soil and Groundwater Contact by Construction Workers

There are potential health and safety risks associated with the petroleum hydrocarbons, VOCs, and metals detected in Site soils, as well as petroleum hydrocarbons and VOCs detected in groundwater. There is the potential for contact by construction workers with residual chemicals in soil at the Site. The routes of potential exposure to the petroleum hydrocarbons, VOCs, and metals in soil are: dermal (skin) contact with the soil; (2) inhalation of dusts; and (3) ingestion of the soil.

Groundwater occurs on-Site at a depth of 3 to 8 feet bgs. There is the potential for contact by construction workers with residual chemicals in groundwater at the Site. The routes of potential exposure to the petroleum hydrocarbons and VOCs in groundwater are: (1) dermal (skin) contact with groundwater; and (2) inhalation of emissions from exposed water. The greatest potential for human exposure to the petroleum hydrocarbons and VOCs in water will be during soil excavation operations and dewatering activities.

The abovementioned health risks to on-Site construction workers will be minimized by developing and implementing a site-specific health and safety plan. The Site Environmental Manager or representative overseeing removal actions will be responsible for establishing and maintaining proper health and safety procedures to minimize construction worker exposure to Site contaminants. At minimum, the site-specific health and safety plan will include: (1) health and safety training requirements for on-Site personnel; (2) personal hygiene and monitoring equipment to be used during construction to protect and verify the health and safety of the construction workers; (3) additional precautions to be undertaken to minimize direct contact with hazardous substances, including implementation of dust control measures; and (4) a description of the procedures to mitigate any potential health risk to bystanders during subsurface activities.

A Site health and safety officer (HSO) or designee will be on-Site during excavation activities to ensure that all health and safety measures are maintained. The HSO will have the authority to direct and, if necessary, stop all construction activities in order to ensure compliance with the site-specific health and safety plan.

4.7 Site Control

Access to the work zones where soil will be disturbed shall be controlled using caution tape, cones, fencing, steel plates, or other measures to clearly designate the active work area and to prevent access by the public. To minimize the migration of contaminated soils from the Site to

uncontaminated areas, excavated soil shall be covered and secured by temporary fences or other means to prevent unauthorized access.

4.8 Dust/Vapor Control Measures

Dust control measures will be implemented during construction activities at the Site to minimize the generation of dust. Dust generation that will be mitigated includes that associated with excavation activities, truck traffic, ambient wind traversing soil stockpiles, and loading of transportation vehicles.

Dust generation will be minimized using appropriate measures. These measures include but are not limited to the following:

- Mist or spray water while performing excavation activities and loading transportation vehicles;
- Limit vehicle speeds on the property to 5 miles per hour;
- Control excavation activities to minimize the generation of dust;
- Minimize drop heights while loading transportation vehicles; and
- Cover soil stockpiles, if present, with visqueen or tarps.

If the construction area is greater than 4 acres, use enhanced control measures as specified in Table 2 of the BAAQMD California Environmental Quality Act Guidelines (BAAQMD, 1999).

4.9 Decontamination

Decontamination procedures shall be developed by contractors to minimize the equipment contamination during excavation activities. The procedures should include removing loose soil from the vehicle exterior using dry methods, such as brushing, scraping or vacuuming. Soil not removed by dry methods, should be cleaned by pressure washing or steam cleaning. Water collected from the cleaning process should be sampled prior to disposal.

4.10 Monitoring Wells

All groundwater monitoring wells located onsite shall be protected during excavation and construction activities. A map showing the locations of wells currently on the property are shown on Figure 2. Any damage to these wells should be reported immediately. All the wells should be accessible to others during excavation and construction activities. Prior to removal or relocation of any wells, the ACEH shall be notified and well destruction or installation permits shall be obtained from Alameda County Department of Public Works.

4.11 Storm Water Control

Storm water pollution controls shall be implemented by construction contractors to minimize sediment runoff in storm water, which could include soil containing contaminants of concern. Prior to the initiation of the work, the contractors must follow the requirements of the CRWQCB general permit and other permits by the CRWQCB. Storm water pollution controls implemented at the Site will be based on best management practices, such as those described in the "Information on Erosion and Sediment Controls for Construction Projects: A Guidebook," Erosion and Sediment Control Field Manual (CRWQCB, 2002), and the Storm Water Best Management Practices Handbook (CSQA, 2003).

Procedures to prevent erosion and sediment runoff from the Site shall include grading the Site, installing storm water control devices such as temporary earth berms or erecting silt fences around the perimeter of exposed soil at the Site. Straw bale barriers or sediment traps are required to protect the existing catch basins.

4.12 Reporting

After earthwork activities are complete, a report will be prepared to document the relocation and final disposition of soil reused or disposed of offsite. At a minimum, the report will include the dimensions of the excavation and confirmation sample locations. The analytical data will be provided in tables and a Site plan showing sampling locations and limits of excavation and grading will be presented. If applicable, copies of receipts pertaining to the disposition of the soil will be appended to the report.

5.0 CONTINGENCY PLAN

The following contingency plan shall be implemented to address unknown contamination during grading, trenching, and dewatering activities:

- All grading, trench excavation and filling operations, and dewatering operations shall be observed for the presence of free-phase petroleum products, chemicals, or contaminated soil/groundwater. Discolored soil or suspected contaminated soil shall be segregated from clean soil. In the event unexpected, contaminated soil or groundwater is encountered during construction, the contractor shall notify Site Environmental Manager. The Site Environmental Manager shall confirm the presence of the suspect material and direct the contractor to remove, stockpile or contain, and characterize the suspect material(s) identified within the boundaries of the construction area. Continued work at a contaminated site shall require the approval of the Site Environmental Manager.
- A photoionization detector (or other organic vapor detecting device) shall be present during grading and excavation through suspected chemically impacted soil.
- Excavation of VOC-impacted soil will require obtaining and complying with a Bay Area Air Quality Management District Rule 40 permit.
- The extent of removal actions shall be determined on a site-specific basis. At a minimum, the chemically impacted area(s) within the boundary of the construction area and/or trench shall be remediated to the satisfaction of the lead regulatory agency (ACEH) for the site. The Site Environmental Manager or representative overseeing removal actions shall inform the contractor when the removal action is complete.
- In the event that contaminated soil is encountered, all on-site personnel handling or working in the vicinity of the contaminated material shall be trained in accordance with OSHA regulations for hazardous waste operations. These regulations are based on CFR 1910.120 (e) and 8 CCR 5192, which states that “general site workers” shall receive a minimum of 40 hours of classroom training and a minimum of three days of field training. This training provides precautions and protective measures to reduce or eliminate hazardous materials/waste hazards at the work place.
- All excavations shall be filled with structurally suitable fill material which contains non-hazardous contaminant concentrations (if any) that do not exceed ESLs. The cover (cap) shall be repaired and returned to its pre-excavation condition.
- Any project-related dewatering activities shall either discharge into the sanitary sewer, under permit with the EBMUD, or comply with the NPDES permit regulations and an associated SWPPP regarding discharge into storm drains. Such permit requirements typically include on-site treatment to remove pollutants prior to discharge. Alternatively, the

water shall be temporarily stored onsite in holding tanks, pending off-site disposal at an approved disposal facility.

- The Site Environmental Manager shall confirm the presence of the suspect contaminated soil and direct the contractor to remove, stockpile, or contain the suspect material identified within the boundaries of the construction area. Contaminated soil shall either be treated on-site or trucked off-site for disposal at a California licensed facility approved for disposal of such waste.
- After earthwork activities are complete, a report will be prepared to document the relocation and final disposition of soil reused or disposed of offsite. At a minimum, the report will include the dimensions of the excavation and confirmation sample locations. The analytical data will be provided in tables and a Site plan showing sampling locations and limits of excavation and grading will be presented. If applicable, copies of receipts pertaining to the disposition of the soil will be appended to the report.

5.1 Implementation of Site Management Plan

AB&I shall oversee implementation of this SMP at the Site. A copy of this SMP shall be included in all contracts signed with contractors and third party contractors working in the subsurface at the Site. It is the responsibility of the contractor to adhere to this SMP, project specifications, and site safety. The contractor is also responsible for providing a copy of this SMP to its subcontractors.

This SMP was developed based on the current conditions at the Site and applicable regulations. It may be necessary to modify this SMP from time to time for any of several reasons, including the following.

- Change in property use (e.g., addition of buildings to the site);
- Any change in legal requirements;
- Change in environmental conditions;
- Intrusive activity that is not addressed by this SMP; and
- New chemical toxicity information for chemicals present at the Site.

5.2 Limitations

This SMP was prepared to address VOCs, TPH and metals present in the soil and groundwater at the Site and current known site conditions, regulations and laws. This SMP does not address issues related to other chemicals or future site conditions that may be encountered during construction projects, including but not limited to, demolition and construction debris, asphalt, concrete, and asbestos-containing materials. If such materials are encountered during a

construction project, contractors and workers are responsible for complying with all applicable laws pertaining to the handling and disposal of these materials.

The Site-related activities may be subject to federal, state, and local laws and regulations, including those published by U.S. Environmental protection Agency (USEPA), the BAAQMD, California Environmental Protection Agency (Cal-EPA), Alameda County, and the City of Oakland. These regulations address issues such as health and safety, hazardous waste, dust generation, storm water, and community right-to-know. It is the responsibility of the parties involved to ensure that all construction and maintenance activities abide by current applicable laws and regulations.

SGI disclaims any responsibility for any unauthorized use of this SMP. It is understood that while this SMP is intended to provide guidance and establish a framework for the management of residual product in the subsurface in soil to protect human health and the environment, this SMP shall not create any warranties or obligations to AB&I as to implementation, adequacy, or success of protective measures under this SMP.

⊕ *Soil and Grab Groundwater Sample (SGI, 2007)*

-Concentrations in bold exceed Environmental Screening Levels (ESLs) taken from the California Regional Water Quality Control Board, San Francisco Bay Region document entitled, "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater", Interim Final November 2007. Groundwater is not a current or potential source of drinking water, commercial shallow or deep soil (less than or greater than 3 meters), commercial land use.

SOIL SAMPLE RESULTS - FORMER 8,000-GALLON MINERAL SPIRITS/1,1,1-TCA UST AREA - 2007

Notes:

MTBE - Methyl tert butyl ether
(mg/kg) - milligrams per kilogram
TPHg - Total Petroleum Hydrocarbons as Gasoline
TPHd - Total Petroleum Hydrocarbons as Diesel
<0.005 - Not reported at or above laboratory's reporting limit of 0.005 mg/kg
UST - underground storage tank
1,1,1-TCA - 1,1,1-Trichloroethane

-TPHg, BTEX, VOCs and fuel oxygenates analyzed using EPA Method 8260B by Test America Laboratories (TAL), Pleasanton, California

-TPHd analyzed using EPA Method 8015M with silica gel cleanup by TAL, Pleasanton, California

RWQCB ESLs - Environmental Screening Levels taken from the California Regional Water Quality Control Board, San Francisco Bay Region document entitled "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater," Interim Final November 2007, groundwater is not a current or potential source of drinking water.

-Concentrations in bold exceed commercial ESLs for shallow soil (less than 3 meters).

Subject: Fuel Leak Case No. RO0000092 and Geotracker Global ID T0600100065 Well Decommissioning Report, AB&I Foundry, 7825 San Leandro Street, Oakland California 94621

Dear Mr. Wickham:

AB&I respectfully submits the attached Well Decommissioning Report for the AB&I Foundry Site located at 7825 San Leandro Street, Oakland, California.

I declare, under penalty of perjury, that the information and/or recommendations contained in the attached document are true and correct to the best of my knowledge.

Sincerely,

Dave Robinson
Engineering Manager

Attachment: Well Decommissioning Report, AB&I Foundry, 7825 San Leandro Street, Oakland, California

SGI environmental THE SOURCE GROUP, INC.

November 21, 2011

Mr. Dave Robinson
Engineering Manager
AB&I Foundry
7825 San Leandro Street
Oakland, CA 94621

Subject: Report on Well Decommissioning,
AB&I Facility Site,
Oakland, California
Fuel Leak Case No. RO0000092 and GeoTracker Global ID T0600100065

Dear Mr. Robinson:

This report is a summary of the groundwater monitoring well destruction conducted at the AB&I Foundry facility located at 7825 San Leandro Blvd (the Site) in Oakland, California (Figure 1). The well destructions were conducted by The Source Group, Inc. (SGI) on behalf of the AB&I in accordance with the Alameda County Public Works Agency (ACPWA) permit requirements and the ACEH letter titled, "Request for Well Decommissioning for Fuel Leak Case No. RO0000092 and GeoTracker Global ID T0600100065, American Brass & Iron Foundry, 7825 San Leandro Street, Oakland, CA 94621," dated September 22, 2011.

The Site is located in a light industrial area of Oakland (Figures 1 and 2). Elmhurst Creek is located along the southeast corner of the property (Figure 2). The monitoring wells discussed in this closure report were formerly used to assess groundwater quality associated with seven underground storage tanks (USTs). The locations of the subject monitoring wells are shown on Figure 2. Available monitoring well survey and construction information are summarized in Table 1.

All nine monitoring wells located on the Site were destroyed on October 11, 2011 in accordance with the requirements of ACPWA. The following activities were implemented for the destruction of the nine monitoring wells:

- SGI obtained well destruction permits from the ACPWA and arranged for the appropriate inspections by the ACPWA. Copies of the ACPWA well permits are attached to this letter.

3451-C Vincent Road
Pleasant Hill, California 94523
Telephone: (925) 944-2856
Facsimile: (925) 944-2859

- All well destruction activities were performed by Vironex, Inc of Concord, California, with SGI supervision and ACPWA inspection.

- The ACPWA approved tremmie grouting as the appropriate method for closure of the well casings.

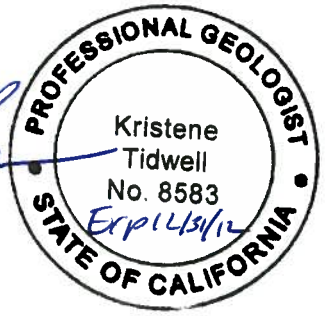
- Wellhead boxes were removed and recycled onsite..

- The wells were grouted from the bottom of the well to the surfaceusing a tremmie pipe and the surfaces were restored.

As required by the California Department of Water Resources, well destruction reports were completed following the destruction of the monitoring wells and are attached to this letter.

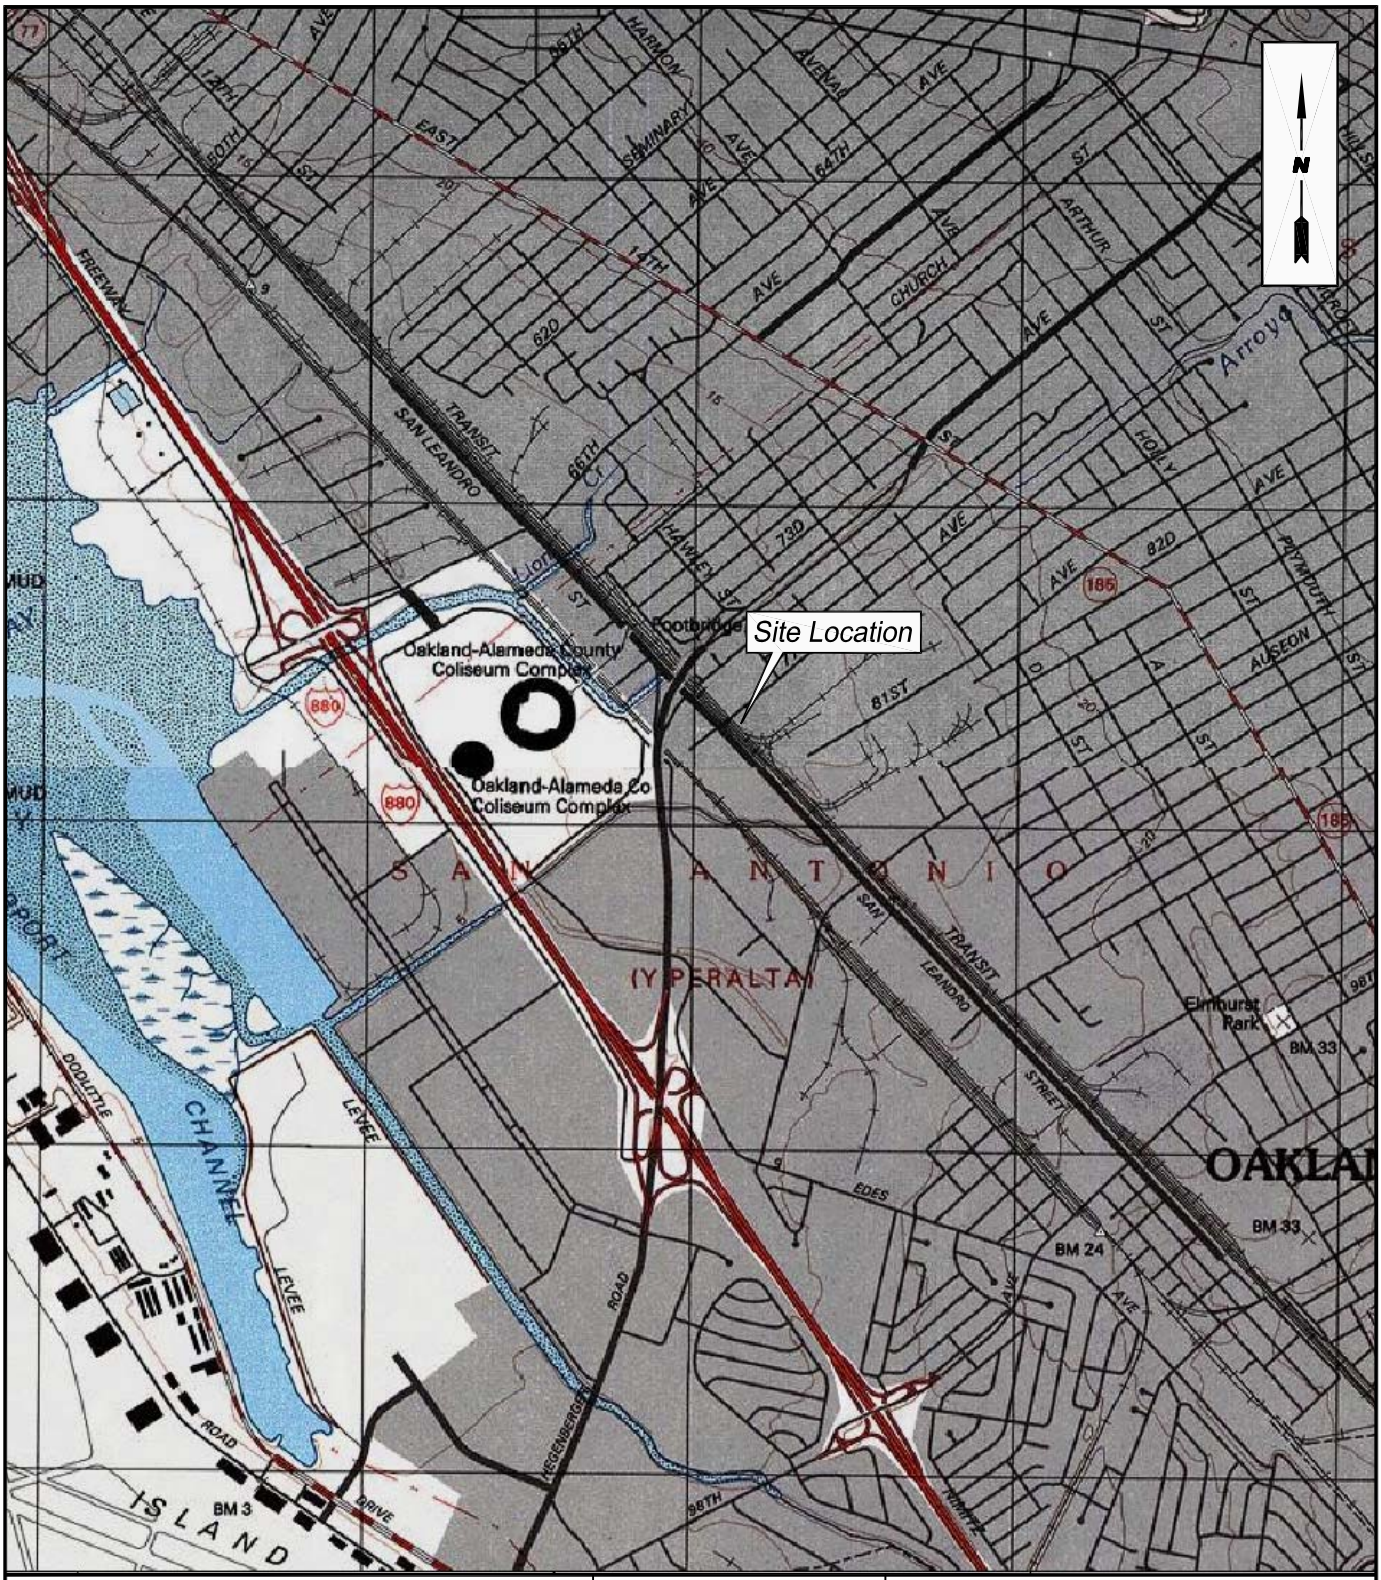
There were no significant deviations from the above procedures during the work.

If you have any questions regarding this report, please contact the undersigned at (925) 944-2856.



Sincerely,

The Source Group, Inc.



Nathan Colton

Specific Work Permit Conditions

1. Drilling Permit(s) can be voided/ cancelled only in writing. It is the applicant's responsibility to notify Alameda County Public Works Agency, Water Resources Section in writing for an extension or to cancel the drilling permit application. No drilling permit application(s) shall be extended beyond ninety (90) days from the original start date. Applicants may not cancel a drilling permit application after the completion date of the permit issued has passed.

2. Prior to any drilling activities, it shall be the applicant's responsibility to contact and coordinate an Underground

Service Alert (USA), obtain encroachment permit(s), excavation permit(s) or any other permits or agreements required for that Federal, State, County or City, and follow all City or County Ordinances. No work shall begin until all the permits and requirements have been approved or obtained. It shall also be the applicants responsibilities to provide to the Cities or to Alameda County an Traffic Safety Plan for any lane closures or detours planned. No work shall begin until all the permits and requirements have been approved or obtained.

3. Compliance with the well-sealing specifications shall not exempt the well-sealing contractor from complying with appropriate State reporting-requirements related to well construction or destruction (Sections 13750 through 13755 (Division 7, Chapter 10, Article 3) of the California Water Code). Contractor must complete State DWR Form 188 and mail original to the Alameda County Public Works Agency, Water Resources Section, within 60 days. Including permit number and site map.

4. Applicant shall submit the copies of the approved encroachment permit to this office within 60 days.

5. Permittee shall assume entire responsibility for all activities and uses under this permit and shall indemnify, defend and save the Alameda County Public Works Agency, its officers, agents, and employees free and harmless from any and all expense, cost and liability in connection with or resulting from the exercise of this Permit including, but not limited to, property damage, personal injury and wrongful death.

6. Applicant shall contact Vicky Hamlin for an inspection time at 510-670-5443 or email to vickyh@acpwa.org at least five (5) working days prior to starting, once the permit has been approved. Confirm the scheduled date(s) at least 24 hours prior to drilling.

7. Permittee, permittee's contractors, consultants or agents shall be responsible to assure that all material or waters generated during drilling, boring destruction, and/or other activities associated with this Permit will be safely handled, properly managed, and disposed of according to all applicable federal, state, and local statutes regulating such. In no case shall these materials and/or waters be allowed to enter, or potentially enter, on or off-site storm sewers, dry wells, or waterways or be allowed to move off the property where work is being completed.

8. Remove the Christy box or similar structure.

Destroy well by grouting neat cement with a tremie pipe or pressure grouting (25 psi for 5min.) to the bottom of the well and by filling with neat cement to three (3-5) feet below surface grade. Allow the sealing material to spill over the top of the casing to fill any annular space between casing and soil.

After the seal has set, backfill the remaining hole with concrete or compacted material to match existing conditions.

9. Copy of approved drilling permit must be on site at all times. Failure to present or show proof of the approved permit application on site shall result in a fine of $500.00.

Township Range Section

Location Sketch

(Sketch must be drawn by hand after form is printed.)

Illustrate or describe distance of well from roads, buildings, fences, rivers, etc. and attach a map. Use additional paper if necessary. **Please be accurate and complete.**

Activity

○ New Well
○ Modification/Repair
○ Deepen
○ Other
◉ Destroy
Describe procedures and materials under "GEOLOGIC LOG"

Planned Uses

○ Water Supply
☐ Domestic ☐ Public
☐ Irrigation ☐ Industrial
○ Cathodic Protection
○ Dewatering
○ Heat Exchange
○ Injection
○ Monitoring
○ Remediation
○ Sparging
○ Test Well
○ Vapor Extraction
○ Other

Water Level and Yield of Completed Well

Depth to first water (Feet below surface)

Depth to Static Water Level (Feet) Date Measured

Estimated Yield * (GPM) Test Type

Test Length (Hours) Total Drawdown (Feet)

*May not be representative of a well's long term yield.

Casings

Depth from Surface Feet	to Feet	Borehole Diameter (Inches)	Type	Material	Wall Thickness (Inches)	Outside Diameter (Inches)	Screen Type	Slot Size if Any (Inches)

Annular Material

Depth from Surface Feet	to Feet	Fill	Description

Attachments

☐ Geologic Log
☑ Well Construction Diagram
☐ Geophysical Log(s)
☐ Soil/Water Chemical Analyses
☐ Other

Attach additional information, if it exists.

1. INTRODUCTION

On behalf of AB&I Foundry ("AB&I"), Ramboll US Consulting, Inc. (Ramboll) has prepared this Current Conditions report regarding property located at 7825 San Leandro Street in Oakland, California (herein referred to as the "site"). The location of the site is shown on Figure 1. The objective of this report is to provide information summarizing current and historical site operations and document the status of environmental conditions at the site.

1.1 Site Description

According to the Alameda County Assessor's Office, the Assessor's Parcel Numbers (APNs) for the site are 41-4175-18, 41-4175-16, 41-4175-6, 41-4175-5, 41-4175-17, 41-4175-19, 41-4209-7, 41-4209-1-2, 41-4209-1-1, 41-4209-3-2, 41-4209-8-1, and 41-4208-1. The site is approximately 13.8 acres in size and located in a mixed commercial/industrial land use area. The majority of the site (approximately 10.8 acres) was purchased by McWane Inc. from Nine Plus Boscacci Group LLC between 2009 and 2010. The remaining approximately 2.5 acres of the site is leased from Nine Plus Boscacci Group LLC. The nearest residential areas are located approximately 1500 feet north and east of the site.

The site is occupied by AB&I, a gray iron foundry which produces cast iron for the manufacture of pipe and pipe fittings. As shown on Figure 2, the site is developed with a two-story office building, multiple warehouses, foundry operations and manufacturing buildings, material storage areas, and a parking lot. The majority of the site is covered with buildings, and asphalt and concrete pavement. Union Pacific Railroad is located immediately adjacent to and west of the site. Primary site access is via San Leandro Street through driveways on the eastern boundary of the site. Elmhurst Creek is located immediately adjacent to the southern corner of the site.

1.2 Regional Setting

The site is located near the San Francisco Bay within an area identified as the East Bay Plain. The East Bay Plain is situated on the east side of the San Francisco Bay depression. The alluvial sediments of the East Bay Plain consist of a mixture of gravel, sand and clay deposited by coalescing alluvial fans. San Leandro Bay (part of San Francisco Bay) is located approximately one mile west of the site. The fluvial deposits near the site are described as unconsolidated, moderately sorted, fine sand and silt, with clayey silt and occasional thin beds of coarse sand (Muir, 1993). The near-shore deposits near the site are described as a well-sorted, fine to medium grained sand and silt, with lenses of sandy clay and clay (SGI, 2008a).

Regional groundwater flow in the vicinity of the site is interpreted to be towards the west/southwest toward San Leandro Bay.

Based on topographic maps and public aerial photographs, the site is relatively level, situated at an elevation of roughly 10 to 14 feet above mean sea level.

1.3 Site Surface Improvements, Soil, and Hydrogeology

Concrete and asphalt paved areas appear to be in generally good condition, except minor deterioration observed in high traffic areas. Based on historical aerial photographs, the majority of the site has been paved since the late 1950s.

The large scrap metal pile area located south of the parking lot is not paved. According to facility personnel, this area was elevated approximately six feet above ground as a result of filling with crushed brick and rock that was imported to the site approximately 20 years ago. The source and nature of the fill material is otherwise unknown.

Shallow soil at the site generally consists of sand/silty clay to a depth of at least 20 feet bgs. Historically, groundwater has been encountered at depths ranging from approximately 4 to 12 feet bgs at the site. Based on groundwater monitoring data from on-site monitoring wells for the period of 1993 through 2006, groundwater flow may be variable to the northeast and northwest (BSK, 2007). Based on groundwater monitoring data in July 2010, groundwater generally flows to the northwest at a gradient of ranging between 0.002 to 0.008 feet per foot (ft/ft; SGI, 2010). A summary of groundwater elevation measurements from 2010 are provided in Table 1.

Additional details regarding site-specific subsurface characteristics and conditions are provided in Section 2. These details are based on a review of prior environmental investigations.

1.4 Site History

AB&I was founded in 1906 and has been operating at the site since approximately 1941.[1] To obtain more information regarding site history, Ramboll interviewed site personal, and reviewed documents provided by the facility as well as historical aerial photographs and Sanborn Fire Insurance Maps obtained from a third-party provider.

Ramboll reviewed aerial photographs and satellite imagery[2] from 1939, 1946, 1958, 1963, 1968, 1974, 1982, 1993, 1998, 2005, 2009, 2012, and 2016. The site appears to be under development in the 1939 through 1946 photographs. A portion of the site appears to be graded in 1946. In the 1958 photograph, the majority of the site appears to be paved and the site generally appears to be in its current configuration. No changes are visible until the 1993 photograph, when the main building appears to have expanded to the northwest near the western boundary. No other changes are apparent in photographs after 1993.

Ramboll reviewed Sanborn Fire Insurance Maps from 1925, 1950, 1952, 1959, 1960, 1961, 1965, 1968, and 1969. The site appears vacant on the 1925 map. In the 1952 map, several structures are shown, possibly manufacturing buildings in the middle part of the site. In the 1959 map, the northern side and southern side of the site are developed into yards for "iron processing", and the site appears to be generally in its current configuration. No significant changes are apparent across the site in the maps from 1960, 1961, 1965, 1968, and 1969.

1.1 Site Operations

Based on a review of documents provided by site personnel, operations at the site involve the production of cast iron for the manufacturing of drain-waste-vent (DWV) fittings and

[1] Based on a U.S. Environmental Protection Agency (USEPA) Toxic Substances Control Act Final Report in 2007, the site was established at current location in 1941.

[2] In addition to aerial photographs provided by the third-party provider, Ramboll viewed historical satellite imagery provided via Google Earth. Printed copies were not obtained, and imagery dates were not independently verified.

pipe from recycled scrap iron. The facility accepts scrap iron and steel, which it stockpiles on-site and uses to produce cast iron for fitting and piping manufacturing operations.

Major operations involve scrap metal melting, mold making, fitting and pipe casting, and final finishing and coating of pipes and fittings.

During metal melting, scrap iron is melted in the cupola by burning coke. Silicon carbide and limestone is added to the cupola to alter the composition and remove impurities from the molten metal. Afterburners and a baghouse are utilized to abate cupola operations.

For fittings and custom castings, molten metal is transferred to an electric induction holding furnace and then poured into greensand molds, allowed to cool and harden, and then removed from the sand molds during shakeout. The castings are then conveyed to grinding and finishing where burrs and other excess metal are removed. The pipe fittings are then coated to prevent corrosion. Baghouses are used to control captured particulate emissions.

At pipe casting machines, molten metal is poured into a permanent mold centrifugal casting machine as the machine rotates, and the molten metal solidifies as it cools against the mold wall. Excess metal is removed during grinding. For approximately the last ten years, the pipes are dipped into asphalt to prevent corrosion. Historically, a solvent-based[3] coating was applied to the pipes. Asphalt coating operations are abated by mist eliminators (BAAQMD, 2021).

AB&I has several buildings and indoor/outdoor work areas with various operational and process support equipment including an emergency diesel generator, compressors, process equipment containing liquid asphalt, portable equipment, trash compactors, and an oil storage area.

1.1.1 Material Storage

AB&I currently stores asphalt, diesel, oil, gasoline, resins, and other oils in above-ground storage tanks, portable holding tanks, and 55-gallon drums. Bulk oils, drums, and portable containers are delivered via truck. There are currently no buried or partially buried storage tanks at the site. Oil filled electrical, operating, and manufacturing equipment at the site includes hydraulic oil reservoirs on various machines, electrical transformers, and asphalt dip tanks (AB&I, 2020).

As discussed further in Section 2, seven underground storage tanks (USTs) were previously located at the site, including one 8,000-gallon UST used for storing unleaded gasoline, one 8,000-gallon UST used for the storage of mineral spirits and later 1,1,1-trichloroethane (1,1,1-TCA), one 550-gallon UST used for storing regular leaded gasoline, one 10,000-gallon UST used for storing diesel, and three 10,000-gallon USTs used for storing gasoline (Figure 4). All USTs have been removed from the site. UST removal activities were initiated in 1982 and completed in the early 1990s. Excavation of impacted soil was performed as part of UST removal activities (see Section 2.1 and Figure 5).

[3] Primary component of the solvent was reportedly 1,1,1-trichloroethane

Oils containing polychlorinated biphenyl-containing (PCBs) were used historically in electrical equipment, primarily in a generator room and transformers centrally located at the facility.

1.1.2 Water Use

East Bay Municipal Utility District (EBMUD) provides water to the site and vicinity from Sierra-fed surface water sources. There was a former on-site industrial water supply well located along the southwest perimeter of the site. The water well was used by AB&I as a source for process (cooling) water for plant operations. Records reviewed indicate a well depth of 495 feet below ground surface (bgs), completed from 175 to 495 feet (ACEH, 2011). In 1993, facility operations used approximately 362,752 gallons per day (gpd) of well water and 12,000 gpd of EBMUD water. By 2008, well water use had decreased significantly, to approximately 15,000 gpd (SGI, 2008a). The use of the water well ceased in 2011. It is unknown whether the well was closed and abandoned in accordance with State and County requirements.

1.1.3 Wastewater and Storm Water Management and Discharge

A wastewater/process water treatment plant was installed in 1989, to pre-treat process water prior to discharge. Prior to 1993, treated process water was discharged to Elmhurst Creek in accordance with the National Pollutant Discharge Elimination System (NPDES) permit CA0027952 (California Regional Water Quality Control Board [RWQCB] Order No. 88-090). In the early 1990s, there were violations and environmental lawsuits with WaterKeepers Northern California ("BayKeeper") related to discharge of contaminated cooling water in Elmhurst Creek. Permit violations issued in 1995 and 1996 were related to phenolic compounds and total toxic organics. The RWQCB issued a Cleanup and Abatement Order No.95-149 on July 13, 1995, which is further discussed in Section 2. In approximately 1995 or 1996, the treatment system was modified to recycle process water. With a closed loop recycling system, discharge of the effluent to Elmhurst Creek was eliminated. In 2005, additional modifications to the treatment system were performed to increase treatment capacity. The majority of process water is recycled through the plant's wastewater treatment system. Process wastewater that is not recycled is discharged to the sanitary sewer under a wastewater discharge permit from EBMUD (SGI, 2008a).

Currently, storm water management at the facility is controlled through five storm water collection outfalls (Outfalls 1 through 5). In 2014, AB&I modified the piping systems such that storm water runoff (except in the Outfall 4 [parking lot area]) is discharged to the on-site storm water treatment system located at Outfall 1, which consists of three settling tanks and two filtration units. Discharges from the storm water treatment system at Outfall 1 flow to the municipal storm sewer system, which ultimately discharges to Elmhurst Creek. Storm water flow that exceeds the design capacity of the on-site treatment system is discharged to the municipal storm water sewer system. The parking lot area (Outfall 4) is isolated from industrial use; therefore, storm water runoff is discharged directly to the municipal storm water sewer system. If needed for reuse, the facility has the ability to collect and transfer storm water from Outfall 2 and 3 to the process water treatment plant to be recycled and used for in-plant processes.

Limited information is available regarding the historical storm drain system at the site. In December 2003, BayKeeper informed AB&I that the facility had violated the NPDES permit and discharged storm water containing pollutants during rainfall events from 1998 to 2003.

AB&I was asked to (and implemented) improve Best Management Practices (BMPs) and adequately implement the Storm Water Pollution Prevention Plan (SWPPP).

2. PREVIOUS ENVIRONMENTAL ACTIVITIES

2.1 Historical Wastewater Management: Metals Release to Surface Water

In relation to historical process wastewater management issues noted in section 1.6.3, the site is a historical listing on the Cleanup Program Sites - Spills, Leaks, Investigations, and Cleanups (CPS-SLIC) database in relation to arsenic, chromium, copper, lead and other metals releases to surface water. During an April 14, 1995 site inspection and again on May 3, 1995, RWQCB staff observed a black powdery waste material throughout the site on the paved areas and outside of the facility. The black and gritty material was sampled, analyzed and determined to consist of lead, zinc, copper, chromium, and arsenic at concentrations in excess of allowable concentrations (the specific comparison criteria is unspecified in agency documentation). Deposits of the waste material were observed in Elmhurst Creek at the Outfall 1 and was similar to the material found on the paved areas of the discharger's facility. Details are presented in Cleanup and Abatement Order 95-149. With respect to this cleanup order, RWQCB granted case closure in September 2011.

2.2 UST Removal Activities

The site is listed on the Leaking Underground Storage Tank (LUST) database for gasoline impacts to groundwater, and generally in relation releases to seven former USTs formerly located at the facility. Information regarding the UST removals, except the three 10,000-gallon gasoline USTs from the early 1980s, were documented in respective UST closure reports provided by AB&I personnel. The full duration of years of operation of the USTs is not known. UST locations, and known sample and excavation areas are shown on Figures 4 and 5.

- Three 10,000-gallon gasoline USTs were removed from the site circa 1982 to 1983 by AB&I. The USTs were part of a service station historically operated by the Olympic Oil Company and included two fuel dispensers. The excavation was backfilled using imported soil and soil excavated during the UST removal activities. No samples are known to have been collected.

- An 8,000-gallon UST used for storing unleaded gasoline and associated piping were removed in August 1991. Approximately 20 cubic yards of soil were removed from the tank pit and disposed of off-site. Gasoline-range petroleum hydrocarbons (TPHg) were reported at concentrations less than 1 milligrams per kilogram (mg/kg) in one soil sample collected, and benzene, toluene, ethylbenzene, and xylene (BTEX) were not detected above laboratory reporting limits.

- A 550-gallon UST used for storing regular leaded gasoline and associated piping was removed on August 25, 1991. Approximately 50 cubic yards of soil were removed from the tank pit and disposed of off-site. Residual impacts on the west and south sides of the tank pit could not be removed due to the presence of underground utilities and foundations. TPHg was reported at residual concentrations of 100 mg/kg and 410 mg/kg in soil samples collected along the western and southern perimeter of the excavation.

- An 8,000-gallon UST used for the storage of mineral spirits and, later, 1,1,1-TCA was removed on October 4, 1991. The excavation was extended 4 to 6 feet from the sides of the tank pit. Along the northern side of the tank pit, a tar-like substance was found

at 3.5 feet bgs. The substance was partially removed, but due to the presence of concrete surface structures, the excavation was terminated. Approximately 180 cubic yards of contaminated soil were removed from the site for off-site disposal. Soil samples from soil below and around the former tank pit had low concentrations of 1,1,1-TCA, ranging from 0.02 mg/kg to 1.3 mg/kg.

- A 10,000-gallon UST used for storing diesel was removed from the southern portion of the site on June 3, 1992. Approximately 180 cubic yards of contaminated soil was excavated for off-site disposal. Due to the presence of a concrete surface slab, the excavation was terminated. Relatively low levels of volatile organic compound (VOC) contamination were observed with a photoionization detector during UST removal. No samples are known to have been collected.

2.3 Initial Monitoring Well Installations and Investigation

Various investigations have been conducted at the site since 1991. In 1993, following the UST removals, four groundwater monitoring wells (MW-1 through MW-4) were installed, adjacent to four former USTs. Locations of groundwater wells can be found in Figure 4. Well construction details can be found in Table 1. Elevated concentrations of petroleum hydrocarbons were reported in soil and groundwater samples from MW-1, MW-2, and MW-4.

Between 1993 and 1997, quarterly groundwater monitoring was conducted and sampling results indicated the presence of relatively low levels of petroleum hydrocarbons and chlorinated VOCs in groundwater in the vicinity of the former USTs.

In July 2006, a soil and groundwater assessment was conducted as part of a property transfer. Monitoring well MW-2 was destroyed and replaced with well MW-2R. In addition, five new groundwater monitoring wells (MW-5 through MW-9) were installed. Results of the July/August 2006 sampling event indicated that five of the nine wells contained concentrations of at least one chemical in excess of stringent screening criteria (e.g., U.S. Environmental Protection Agency [USEPA] maximum contaminant level [MCL] or San Francisco Bay RWQCB Environmental Screening Levels [ESLs; BSK, 2007]).

Additionally (and unrelated to the former USTs), an investigation conducted in the northern corner of the site (reportedly a historical waste oil recovery facility) in approximately 2006 included the collection and analysis of 13 near surface (0-0.5 feet bgs) soil samples for TPHd, TPHmo, and PCBs. TPHd results in five of the 13 samples exceeded current (2019) commercial/industrial screening criteria. No other results (including TPHmo and PCBs) exceeded 2019 commercial/industrial screening criteria.

2.4 2007-2008 Site Investigation

Beginning in 2007, the Source Group, Inc. (SGI) on behalf of AB&I, investigated soil and groundwater conditions at the site following the removal of the seven USTs.

In November 2007, soil gas samples were collected from 10 locations to assess potential vapor intrusion issues to indoor air. Soil gas sampling results can be found in Table 4. In addition, 31 soil borings were advanced to define the source and extent of total petroleum hydrocarbons (TPH) and VOC-affected soil and groundwater. Six additional borings were advanced in the parking lot along the eastern boundary of the site to assess the lateral extent of VOC-affected groundwater. Available soil sampling results can be found in Tables

5 and Table 6. Groundwater sampling was conducted via monitoring wells and grab samples. For groundwater, the highest concentrations of 1,1,1-TCA and vinyl chloride in groundwater at the site were detected in the parking lot area. Groundwater sampling results indicated that shallow groundwater near MW-8 was impacted with chlorinated VOCs and shallow groundwater near MW-9 was impacted with petroleum fuels (Table 3).

In July 2008, additional site investigations were conducted by SGI and soil gas samples were collected at five locations near the office building adjacent to the 550-gallon gasoline UST area (Table 4, Figure 3). Additional soil borings were advanced to assess the contamination in soil and in groundwater. Available soil and grab groundwater sampling results are shown in Table 5 and Table 3. Deep groundwater samples (below 40 feet bgs) collected in the former three 10,000-gallon USTs area (near MW-9) had TPH concentrations above the current most stringent regulatory screening criteria.

The 2008 sampling data showed that TPH and chlorinated VOCs were present in shallow groundwater underlying the central area of the site. Groundwater samples collected from two wells (MW-3 and MW-8) located in the parking lot had concentrations of vinyl chloride above current regulatory screening levels for commercial/industrial land use (see Table 3). Deep groundwater underlying the site contained concentrations of TPH and low concentrations of chlorinated VOCs (Table 3).

Soil gas samples collected in the vicinity of the office building had exceedances of current regulatory screening levels for commercial/industrial land use for vinyl chloride in two locations (SG-12 and SG-16B) at 5-feet bgs. There were also exceedances of tetrachloroethene (PCE), ethylbenzene, and benzene in soil gas samples (Table 4).

In March 2009, as part of a supplemental soil vapor investigation conducted by SGI, three soil gas samples (SG-17 through SG-19) were collected in the area of the employee training classroom, locker room and lunchroom. PCE and benzene were the most prevalent compounds in soil gas in the vicinity of the office building. PCE was detected at a concentration of 3.1 ug/L (SG-19) at 1.5 feet bgs, which exceeded current regulatory screening criteria for commercial/industrial land use (Table 4).

2.5 2009 Bioremediation Pilot Study

In June 2009, pilot studies were conducted by SGI to address chlorinated solvents in groundwater in the parking lot area and petroleum hydrocarbons in the eastern area (near MW-9) of the site.

An enhanced aerobic biodegradation (EAB) pilot study occurred near the former three 10,000-gallon USTs (near MW-9) to promote the breakdown of petroleum hydrocarbons. Injection activities were initially effective in reducing benzene and toluene concentrations but some rebound was observed. TPHg and diesel-range petroleum hydrocarbons (TPHd) concentrations remained relatively stable. Benzene and TPH concentrations in downgradient wells (MW-4, MW-2R and MW-5) were below laboratory detection limits, indicating that the relatively low residual impacts were isolated to the area in the vicinity of MW-9 (SGI, 2009c).

An enhanced anaerobic biodegradation (EAnB) pilot study occurred at the site beneath the parking lot area (near MW-3 and MW-8) to promote the breakdown of chlorinated VOCs

(1,1,1-TCA, 1,1-dichloroethane [1,1-DCA], chloroethane, 1,1-dichloroethene [1,1-DCE], and vinyl chloride). Significant decreases in chemical concentrations were observed. Sampling results from MW-3 and MW-8 showed that VOC concentrations were reduced by approximately 90% and 70% respectively. For MW-3, concentrations of daughter products (chloroethane, methane, ethene, and vinyl chloride) initially increased following EAnB injections and subsequently decreased, and only vinyl chloride remained present at levels above MCLs. For MW-8, daughter product concentrations follow the same trend as described in MW-3 and continued to decrease, approaching MCL concentrations.

These studies concluded that impacts to soil gas at the site were low and did not warrant remediation or monitoring.

The most recent groundwater sampling results collected by SGI in July 2010 can be found in Table 3. A total of eight chemicals including 1,1-DCA, benzene, chloroethane, ethylbenzene, vinyl chloride, and naphthalene, TPHg, and TPHd were present above the most stringent regulatory screening criteria in at least one location, including TPHg in monitoring wells MW-2R, MW-4, MW-5, MW-8, and MW-9. These wells were located in the office and shipping storage area on the eastern boundary of the site, and maximum TPHg, TPHd, and benzene concentrations were observed in MW-9, near the former location of the three 10,000-gallon USTs.

2.6 Regulatory Closure for LUST matter

The Alameda County Department of Environmental Health (ACDEH) granted case closure related to the LUST case and related groundwater contamination in November 2011. The closure documentation is provided in Appendix B. The site was closed with a Covenant and Environmental Restriction on Property (deed restriction) that limits future land use to industrial. In their closure letter, ACDEH indicated that no further investigation or cleanup for the fuel leak case is necessary unless a change in land use occurs at the site. A Site Management Plan (SMP) is also in place to control potential future exposure to residual contamination (Appendix C). The monitoring wells were decommissioned in November 2011.

2.7 Recent Soil Excavations

No environmental investigations or other assessment were available for review after the LUST case closure in 2011. However, excavation activities performed by the facility as part of routine site maintenance and improvement activities include the following areas: the parking lot (August 2019); scrap pile (September 2019); shipping and storage buildings (January 2020); storm water retention area (March 2020); and railroad track area (March and June 2021). Soil samples were collected from stockpiles and analyzed for metals and petroleum hydrocarbons.

All available results can be found in Table 7. For several areas, including the scrap pile, new transformer vault area, diesel tank/shipping building, storage building, storm water collection area, and railroad track area, lead concentrations in soil exceeded the regulatory screening levels for commercial/industrial land use as well as thresholds for classification as a California hazardous waste.

3. SITE CHARACTERIZATION SUMMARY

3.1 Summary of Known Impacts

Based on investigation activities performed at the site to date, the status of soil, groundwater, and soil vapor impacts identified at the site are described below.

In general, potential contaminant concerns may include one or more of the following in one or more media: VOCs, TPH, pH, PCBs, and metals.

3.1.1 Groundwater

Previous studies concluded that concentrations of VOCs and petroleum hydrocarbons in groundwater were stable or declining. The most recent sampling results in July 2010 indicated that eight chemicals (1,1-DCA, benzene, chloroethane, ethylbenzene, vinyl chloride, and naphthalene, TPHg, and TPHd) were present above the most stringent regulatory screening criteria in at least one location, although it is unlikely that the most stringent (e.g., those based on residential land use or drinking water standards) are applicable for the site. Previous groundwater samples have not included metals analyses.

3.1.2 Soil Vapor

As mentioned in Section 2, in approximately 2009, a supplemental soil vapor investigation and two bioremediation pilot studies for VOCs in groundwater were performed. Soil gas concentrations in the northeastern portion of the site were confirmed to be low and ACDEH issued case closure. According to facility personnel, use of VOCs at the site over the past 10 years since discontinuation of the 1,1,1-TCA coating process has been very limited. Based on existing data, it does not appear that impacts to soil gas at the site are significant, and concentrations do not warrant remediation or monitoring.

3.1.3 Soil

Based on soil sampling results from 2007 to 2008, chemicals identified at concentrations exceeding the regulatory screening levels for commercial/industrial land use included ethylbenzene, TPHd, arsenic, lead, and thallium.

Although the majority of the site has been paved for many years, elevated concentrations of lead have been identified in soil excavated from beneath the pavement for facility construction projects from 2016 to 2021. In addition, the scrap metal pile area located south of the parking lot is not paved; this area has been raised approximately six feet above the ground with crushed brick and soil from an unknown off-site source.

3.2 Regulatory Status and Considerations

There is no current environmental regulatory oversight regarding subsurface contamination matters at the site. ACDEH issued case closure for historical USTs and associated impacts in 2011. Due to the presence of residual concentrations of COPCs in soil, a deed restriction was recorded that limits future land use to industrial and requires implementation of an SMP.

Notes:
All data are reported in micrograms per liter (µg/L).
-- = Not Available
* = Reported due to the presence of discrete peaks
TPHg = Total Petroleum Hydrocarbons as Gasoline
TPHd = Total Petroleum Hydrocarbons as Diesel
1,1-DCE = 1,1 - Dichloroethene
1,1-DCA = 1,1 - Dichloroethane
1,2-DCA = 1,2 - Dichloroethane
1,1,1-TCA = 1,1,1-Trichloroethane
trans-1,2-DCE = Trans-1,2-dichloroethene
cis-1,2-DCE = Cis-1,2-dichloroethene
MTBE = Methyl tert-butyl ether
PCE = Tetrachloroethylene
TBA = Tertiary butyl alcohol
TCE = Trichloroethylene
<0.50 = not reported at or above laboratory's reporting limit of 0.50 µg/L
J = analyte detected below quantitation limits
SFRWQCB = San Francisco Bay Regional Water Quality Control Board
ESL = Environmental Screening Levels
Blue shading denotes detected concentration in excess of screening criteria.
Bold highlight means the most recent data available (July 2010).

COVENANT AND ENVIRONMENTAL RESTRICTION
ON PROPERTY

AB&I Foundry
7825 San Leandro Street
Oakland, California

This Covenant and Environmental Restriction on Property (this "Covenant") is made as of the 21st day of September, 2011 by McWane, Inc. ("Covenantor") who is the Owner of record of that certain property situated at 7825 San Leandro Street, in the City of Oakland, County of Alameda, State of California, which is more particularly described in Exhibit A attached hereto and incorporated herein by this reference (such portion hereinafter referred to as the "Burdened Property"), for the benefit of the Alameda County Environmental Health Services (the "County"), with reference to the following facts:

A. The Burdened Property and groundwater underlying the property contains hazardous materials.

B. Contamination of the Burdened Property. Soil at the Burdened Property was contaminated by previous industrial operations, including but not limited to the manufacture of cast pipe and fittings and warehousing operations and by releases from six underground fuel storage tanks formerly present at the Burdened Property. These operations resulted in contamination of soil and groundwater with organic chemicals including petroleum hydrocarbons, primarily benzene, toluene, ethylbenzene, and xylene; and chlorinated solvents, primarily 1,1,1-TCA, 1,1-dichloroethane (1,1-DCA), 1,1-dichloroethene (1,1-DCE), chloroethane, cis-and trans-1,2-dichloroethene (1,2-DCE), and vinyl chloride. These constituents constitute hazardous materials as that term is defined in Health & Safety Code Section 25260. To treat and control migration of contaminated soil and groundwater, several remedial actions were conducted at the Burdened Property including excavation and off-site disposal of contaminated

soil in the immediate vicinity of the UST areas and implementation of an enhanced biodegradation injection program.

C. Exposure Pathways. The contaminants addressed in this Covenant are present in soil and groundwater on the Burdened Property. Without the mitigation measures which have been performed on the Burdened Property, exposure to these contaminants could take place via exposure during future soil excavation resulting in dermal contact, inhalation, or ingestion by humans.. The risk of public exposure to the contaminants has been substantially lessened by the remediation and controls described herein.

D. Adjacent Land Uses and Population Potentially Affected. The Burdened Property is used for the manufacture of cast pipe and fittings and warehousing operations and is adjacent to industrial and commercial land uses and is adjacent to industrial and commercial land uses land uses.

E. Full and voluntary disclosure to the County of the presence of hazardous materials on the Burdened Property has been made and extensive sampling of the Burdened Property has been conducted.

F. Covenantor desires and intends that in order to benefit the County, and to protect the present and future public health and safety, the Burdened Property shall be used in such a manner as to avoid potential harm to persons or property that may result from hazardous materials that may have been deposited on portions of the Burdened Property.

ARTICLE I
GENERAL PROVISIONS

1.1 Provisions to Run with the Land. This Covenant sets forth protective provisions, covenants, conditions and restrictions (collectively referred to as "Restrictions") upon and subject to which the Burdened Property and every portion thereof shall be improved, held, used, occupied, leased, sold, hypothecated, encumbered, and/or conveyed. The restrictions set forth in Article III are reasonably necessary to protect present and future human health and safety or the environment as a result of the presence on the land of hazardous materials. Each and all of the Restrictions shall run with the land, and pass with each and every portion of the Burdened Property, and shall apply to, inure to the benefit of, and bind the respective successors in interest thereof, for the benefit of the County and all Owners and Occupants. Each and all of the Restrictions are imposed upon the entire Burdened Property unless expressly stated as applicable to a specific portion of the Burdened Property. Each and all of the Restrictions run with the land pursuant to section 1471 of the Civil Code. Each and all of the Restrictions are enforceable by the County.

1.2 Concurrence of Owners and Lessees Presumed. All purchasers, lessees, or possessors of any portion of the Burdened Property shall be deemed by their purchase, leasing, or possession of such Burdened Property, to be in accord with the foregoing and to agree for and among themselves, their heirs, successors, and assignees, and the agents, employees, and lessees of such owners, heirs, successors, and assignees, that the Restrictions as herein established must be adhered to for the benefit of the County and the Owners and Occupants of the Burdened Property

and that the interest of the Owners and Occupants of the Burdened Property shall be subject to the Restrictions contained herein.

1.3 Incorporation into Deeds and Leases. Covenantor desires and covenants that the Restrictions set out herein shall be incorporated in and attached to each and all deeds and leases of any portion of the Burdened Property. Recordation of this Covenant shall be deemed binding on all successors, assigns, and lessees, regardless of whether a copy of this Covenant and Agreement has been attached to or incorporated into any given deed or lease.

1.4 Purpose. It is the purpose of this instrument to convey to the County real property rights, which will run with the land, to facilitate the remediation of past environmental contamination and to protect human health and the environment by reducing the risk of exposure to residual hazardous materials.

ARTICLE II
DEFINITIONS

2.1 County. "County" shall mean the Alameda County Environmental Health Services and shall include its successor agencies, if any.

2.2 Improvements. "Improvements" shall mean all buildings, roads, driveways, regradings, and paved parking areas, constructed or placed upon any portion of the Burdened Property.

2.3 Occupants. "Occupants" shall mean Owners and those persons entitled by ownership, leasehold, or other legal relationship to the exclusive right to use and/or occupy all or any portion of the Burdened Property.

2.4 Owner or Owners. "Owner" or "Owners" shall mean the Covenantor and/or its successors in interest, who hold title to all or any portion of the Burdened Property.

ARTICLE III
DEVELOPMENT, USE AND CONVEYANCE OF THE BURDENED PROPERTY

3.1 Restrictions on Development and Use. Covenantor promises to restrict the use of the Burdened Property as follows:

a. Development of the Burdened Property shall be restricted to industrial;

b. No residence for human habitation shall be permitted on the Burdened Property;

c. No hospitals shall be permitted on the Burdened Property;

d. No schools for persons under 21 years of age shall be permitted on the Burdened Property;

e. No day care centers for children or day care centers for Senior Citizens shall be permitted on the Burdened Property;

f. No Owners or Occupants of the Property or any portion thereof shall conduct any excavation work on the Property, unless expressly permitted in writing by the County. Any contaminated soils brought to the surface by grading, excavation, trenching, or backfilling shall be managed by Covenantor or his agent in accordance with all applicable provisions of local, state and federal law. Notwithstanding the foregoing, Covenantor may perform routine landscaping and maintenance of surface improvements thereon;

g. All uses and development of the Burdened Property shall be consistent with any applicable County Cleanup Order or Risk Management Plan, each of which is hereby incorporated by reference including future amendments thereto. All uses and development shall preserve the integrity of any cap, any remedial measures taken or remedial equipment installed, and any groundwater monitoring system installed on the Burdened Property pursuant to the requirements of the County, unless otherwise expressly permitted in writing by the County.

h. With the exception of the use of the one existing onsite water supply well for industrial water supply, no Owners or Occupants of the Property or any portion thereof shall drill, bore, otherwise construct, or use a well for the purpose of extracting water for any use, including but not limited to, domestic, potable, or industrial uses, unless expressly permitted in writing by the County.

i. The Owner shall notify the County of each of the following: (1) The type, cause, location and date of any disturbance to any cap, any remedial measures taken or remedial equipment installed, and of the groundwater monitoring system installed on the Burdened Property pursuant to the requirements of the County, which could affect the ability of such cap or remedial measures, remedial equipment, or monitoring system to perform their respective functions and (2) the type and date of repair of such disturbance. Notification to the County shall be made by registered mail within ten (10) working days of both the discovery of such disturbance and the completion of repairs;

j. The Covenantor agrees that the County, and/or any persons acting pursuant to County cleanup orders, shall have reasonable access to the Burdened Property for the purposes of inspection, surveillance, maintenance, or monitoring, as provided for in Division 7 of the Water Code.

k. No Owner or Occupant of the Burdened Property shall act in any manner that will aggravate or contribute to the existing environmental conditions of the Burdened Property. All use and development of the Burdened Property shall preserve the integrity of any capped areas.

l. No Owner or Occupant of the Burdened Property shall use the Burdened Property to grow fruits or vegetables for consumption.

3.2 Enforcement. Failure of an Owner or Occupant to comply with any of the restrictions, as set forth in paragraph 3.1, shall be grounds for the County, by reason of this Covenant, to have the authority to require that the Owner modify or remove any Improvements constructed in violation of that paragraph. Violation of the Covenant shall be grounds for the County to file civil actions against the Owner as provided by law.

3.3 Notice in Agreements. After the date of recordation hereof, all Owners and Occupants shall execute a written instrument which shall accompany all purchase agreements or leases relating to the property. Any such instrument shall contain the following statement:

> The land described herein contains hazardous materials in soils and in the ground water under the property, and is subject to a deed restriction dated as of _____, 2011, and recorded on _____, 2011, in the Official Records of _____ County, California, as Document No. _____, which Covenant and Restriction imposes certain covenants, conditions, and restrictions on usage of the property described herein. This statement is not a declaration that a hazard exists.

ARTICLE IV
VARIANCE AND TERMINATION

4.1 Variance. Any Owner or, with the Owner's consent, any Occupant of the Burdened Property or any portion thereof may apply to the County for a written variance from the provisions of this Covenant.

4.2 Termination. Any Owner or, with the Owner's consent, any Occupant of the Burdened Property or a portion thereof may apply to the County for a termination of the Restrictions as they apply to all or any portion of the Burdened Property.

4.3 Term. Unless terminated in accordance with paragraph 4.2 above, by law or otherwise, this Covenant shall continue in effect in perpetuity.

ARTICLE V
MISCELLANEOUS

5.1 No Dedication Intended. Nothing set forth herein shall be construed to be a gift or dedication, or offer of a gift or dedication, of the Burdened Property or any portion thereof to the general public.

5.2 Notices. Whenever any person gives or serves any notice, demand, or other communication with respect to this Covenant, each such notice, demand, or other communication shall be in writing and shall be deemed effective (1) when delivered, if

personally delivered to the person being served or official of a government agency being served, or (2) three (3) business days after deposit in the mail if mailed by United States mail, postage paid certified, return receipt requested:

If To: "Covenantor"

Oakland, California 94621-2598

If To: "County"
Alameda County Environmental Health Services
Attention: Director
1131 Harbor Bay Parkway
Alameda, California 94502

5.3 Partial Invalidity. If any portion of the Restrictions or terms set forth herein is determined to be invalid for any reason, the remaining portion shall remain in full force and effect as if such portion had not been included herein.

5.4 Article Headings. Headings at the beginning of each numbered article of this Covenant are solely for the convenience of the parties and are not a part of the Covenant.

5.5 Recordation. This instrument shall be executed by the Covenantor and by the Director of Environmental Health Services. This instrument shall be recorded by the Covenantor in the County of _____ within ten (10) days of the date of execution.

5.6 References. All references to Code sections include successor provisions.

5.7 Construction. Any general rule of construction to the contrary notwithstanding, this instrument shall be liberally construed in favor of the Covenant to effect the purpose of this instrument and the policy and purpose of the Water Code. If any provision of this instrument is found to be ambiguous, an interpretation consistent with the purpose of this instrument that would render the provision valid shall be favored over any interpretation that would render it invalid.

IN WITNESS WHEREOF, the parties execute this Covenant as of the date set forth above.

Subject: Fuel Leak Case No. RO0000092 and Geotracker Global ID T0600100065 Revised Site Management Plan, AB&I Foundry, 7825 San Leandro Street, Oakland California 94621

Dear Mr. Wickham:

AB&I respectfully submits the attached Revised Site Management Plan for the AB&I Foundry Site located at 7825 San Leandro Street, Oakland, California.

I declare, under penalty of perjury, that the information and/or recommendations contained in the attached document are true and correct to the best of my knowledge.

Sincerely,

Dave Robinson
Engineering Manager

CERTIFICATION

All hydrogeologic and geologic information in this document regarding the AB&I Foundry Site have been prepared under the supervision of and reviewed by the certified professional whose signature appears below.

Andrew Zdon, P.G., C.HG.
Principal Hydrogeologist
The Source Group, Inc.

1.0 INTRODUCTION

On behalf of AB&I Foundry (AB&I), The Source Group, Inc. (SGI) has prepared this Revised Site Management Plan (SMP) for the AB&I Site located at 7825 San Leandro Street in Oakland, California (Figure 1; Site).

This SMP has been prepared in response to a letter submitted to AB&I by Alameda County Environmental Health (ACEH) dated April 28, 2011 (ACEH, 2011a). The ACEH April 28, 2011 letter requests that "*In order to prevent potential future exposure to residual contamination and move the site towards case closure, we request that you now submit a draft Covenant and Environmental Restriction on Property (Deed Restriction) along with a Site Management Plan (SMP).*"

An administrative control in the form of a deed restriction will be implemented as part of the case closure. The deed restriction has been prepared under separate cover and specifies that the Site will be limited in development for industrial use. Article III, section 3.1, part f of the deed restriction states:

No Owners or Occupants of the Property or any portion thereof shall conduct any excavation work on the Property, unless expressly permitted in writing by the County. Any contaminated soils brought to the surface by grading, excavation, trenching, or backfilling shall be managed by Covenantor or his agent in accordance with all applicable provisions of local, state and federal law. Notwithstanding the foregoing, Covenantor may perform routine landscaping and maintenance of surface improvements thereon.

Consistent with the deed restriction, this SMP provides a framework to manage residual chemicals in soil at the Site in a manner that is: (1) satisfactory to ACEH and other regulatory agencies, (2) protective of human health and the environment, and (3) consistent with current land uses.

This Revised SMP replaces the Revised SMP dated June 15, 2011. The Revised SMP incorporates comments provided by ACEH in their letter dated June 8, 2011 (ACEH, 2011b) and subsequent verbal comments provided on July 12, 2011.

1.1 Site Location and Description

The Site is located at 7825 San Leandro Street, east of the intersection with 77th Avenue, in a light industrial area of Oakland (Figures 1 and 2). The Site is bounded by commercial/industrial properties to the north, south, east, and west. Union Pacific Railroad is located immediately adjacent to and west of the Site. Oakland Truck Stop is located immediately adjacent to and east of the Site. Elmhurst Creek is located along the southeast corner of the property (Figure 2). San

Leandro Bay is located approximately one mile west of the Site. The entire Site is covered with concrete and asphalt/concrete pavement.

1.2 Purpose and Objectives

The purpose of this SMP is to provide a plan to prevent or minimize human exposure to soil and groundwater contamination at the Site. This SMP was prepared to govern all future redevelopment and/or intrusive work at the Site such as soil excavation, trenching and backfilling activities.

2.0 BACKGROUND

This section provides information about subsurface conditions and remediation activities at the Site.

2.1 Site Operational History

AB&I have been operating at the Site location since at least 1930 (BSK Associates [BSK], 1993). Business activities include the manufacture of cast pipe and fittings. The facility accepts scrap iron and steel, which it stockpiles on-site, and uses during manufacturing activities. The Site encompasses an area of approximately 11.8 acres and contains various warehouses, manufacturing and office buildings. The entire Site is covered with buildings and asphalt/concrete pavement. Seven underground storage tanks (USTs) were previously located on the Site, including one 8,000-gallon UST used for storing unleaded gasoline, one 8,000-gallon UST used for the storage of mineral spirits and later 1,1,1-trichloroethane (1,1,1-TCA), one 550-gallon UST used for storing regular leaded gasoline, one 10,000-gallon UST used for storing diesel, and three 10,000-gallon USTs used for storing gasoline. All UST have been removed from the Site. UST removal activities were initiated in 1982 and completed in the early 1990s.

2.2 Hydrogeologic Setting

The Site is located near the San Francisco Bay within an area identified as the East Bay Plain. The East Bay Plain is situated on the east side of the San Francisco Bay depression. The alluvial sediments of the East Bay Plain consist of a mixture of gravel, sand and clay deposited by coalescing alluvial fans. In the vicinity of the Site, fluvial and near shore deposits have been mapped (Helley et. al., 1979). The fluvial deposits are described as unconsolidated, moderately sorted, fine sand and silt, with clayey silt and occasional thin beds of coarse sand (Muir, 1993). The near-shore deposits are described as a well-sorted, fine to medium grained sand and silt, with lenses of sandy clay and clay. Regional groundwater flow in the vicinity of the Site is interpreted to be towards the west - southwest toward San Leandro Bay.

The Site is underlain by a mixture of sandy/silty clay to a depth of at least 20-feet below ground surface (bgs). Groundwater has been encountered in borings and excavations at depths ranging from 3 to 8-feet bgs at the Site. Groundwater monitoring data from on-site monitoring wells generally flows to the northwest at a gradient of approximately 0.006 feet per foot (ft/ft); (SGI, 2009a).

2.3 Summary of Remedial Actions and Current Environmental Conditions

Initial site assessment activities began in 1991 as part of the facility's UST removal program. The USTs removed consisted of:

- three 10,000-gallon tanks used for storing gasoline (removed 1982/1983);
- one 550-gallon UST used for storing regular, leaded gasoline (removed 1991);
- one 8,000-gallon tank used for storing unleaded gasoline (removed 1991);
- one 8,000-gallon tank initially used for storing mineral spirits and later for storing 1,1,1-trichloroethane (removed 1991); and
- one 10,000-gallon tank used for storing diesel fuel (removed 1992).

Removal of the tanks, with the exception of the three 10,000-gallon gasoline USTs were provided in UST closure reports. The locations of the former USTs are identified on Figure 2.

In July/August 2006, a soil and groundwater assessment was conducted as part of a property transfer. The assessment consisted of sampling three existing monitoring wells (MW-1, MW-3, and MW-4); abandoning damaged well MW-2; and installing and sampling six new groundwater monitoring wells (MW-2R, and MW-5 through MW-9). Soil samples were collected at various depth intervals during the installation of monitoring wells MW-5, MW-6, MW-7, and MW-8. Results of the assessment were presented in the Preliminary Groundwater Investigation Report (BSK, 2007).

In response to a request from ACEH, additional soil, groundwater and soil vapor investigations were conducted in 2007, 2008, and 2009. These investigations included the investigation of shallow groundwater (less than 30 feet bgs) and deep groundwater (greater than 30 feet bgs), and the collection of soil vapor samples. The results of these investigations indicated that shallow groundwater in the vicinity of the Parking Lot Area (located in the vicinity and northwest of well MW-8; Figure 2) was impacted with chlorinated volatile organic compounds (VOCs), including 1,1,1-TCA, 1,1-dichloroethane (1,1-DCA), 1,1-dichloroethene (1,1-DCE), chloroethane, cis-and trans-1,2-dichloroethene (1,2-DCE), and vinyl chloride. Shallow groundwater in the vicinity of the former three 10,000 gallon USTs area (located in the vicinity of well MW-9) was impacted with petroleum fuels including benzene, toluene, ethylbenzene and xylenes (BTEX), total petroleum hydrocarbons as gasoline (TPHg), and total petroleum hydrocarbons as diesel (TPHd). Results of the soil vapor analysis indicated that isolated soil gas samples had indoor air vapor intrusion environmental screening level (ESL) exceedences for benzene, ethylbenzene, vinyl chloride and tetrachloroethene (PCE) under the commercial land use scenario. A site specific risk assessment was conducted and results concluded that the risks posed by soil vapors were acceptable with respect to indoor air exposure under the industrial land use scenario and did not require further action. Further details can be found in SGI's reports titled, "Site Investigation Report," "Additional Site Investigation Report," and "Supplemental Soil Vapor Investigation Report" (SGI 2008a; SGI,

2008b, and SGI, 2009b). ACEH concurred with the report conclusions in a letter dated May 20, 2009.

In order to address residual petroleum hydrocarbons and VOCs in groundwater, enhanced anaerobic biodegradation (EAnB) injections occurred in June 2009 at the Site beneath the parking lot area (near MW-3 and MW-8) and aerobic biodegradation (EAB) injections occurred near the former three 10,000 gallon USTs (near MW-9). Since that time, groundwater monitoring has occurred to track the progress of bioremediation in the subsurface.

Soil sample results associated with the 2007 investigations are summarized in Tables 1 and 2 and Figures 3 through 6. Soil gas sample results for the investigations conducted in 2007, 2008, and 2009 are presented in Figures 7 though 9. Groundwater sample results associated with the 2007 investigations are presented in Figures 10 and 11. Groundwater monitoring well sample results conducted during 2009 and 2010 are summarized in Tables 3 and 4 and groundwater monitoring well sample results conducted during July and December 2010 are presented in Figures 12 through 15.

3.0 SUMMARY OF HUMAN HEALTH RISKS

This section presents a summary of a screening level risk evaluation (SLRE) that was conducted by SGI for the Site. The SLRE included the development of a conceptual site model that was used to evaluate the potential sources, contaminant migration pathways, and potential receptors for the petroleum hydrocarbons and VOCs within the area of and downgradient of the former mineral spirits/1,1,1-TCA UST and former three 10,000-Gallon USTs dispenser island area. The results of the SLRE are summarized below.

3.1.1 Potential Sources

The potential source(s) of contaminants released into the environment are interpreted to be leaks associated with the operation of the former mineral spirits/1,1,1-TCA UST and the former three 10,000-Gallon gasoline USTs dispenser island area.

Previous investigations related to the former mineral spirits/1,1,1-TCA UST removal and subsequent groundwater sampling have identified the presence of 1,1,1-TCA, chloroethane, 1,1-DCA, 1,1-DCE, and vinyl chloride in soil and, or groundwater in the immediate vicinity and downgradient (northwest) of the former mineral spirits/1,1,1-TCA UST (Figure 11). In addition, releases of TPH from the former three 10,000-Gallon gasoline USTs dispenser island area also appear to be commingling with and have impacted groundwater in the area of the former mineral spirits/1,1,1-TCA UST (Figure 10).

Groundwater underlying and south-southwest of the former three 10,000-Gallon gasoline USTs dispenser island area is impacted with TPHg, BTEX, and TPHd. The highest concentrations of TPHg, BTEX, and TPHd were reported in samples collected from beneath the storage goods warehouse, which is located south-southwest of the tank area (Figure 10). Higher concentrations of TPHg, BTEX, and TPHd in groundwater samples collected downgradient of the UST area suggest that excavation of the source area during the removal of the USTs was effective in reducing the source of contaminants to groundwater in the immediate vicinity of the USTs. The presence of elevated concentrations of TPHg, BTEX, and TPHd in groundwater underlying the storage goods warehouse is interpreted to be related to residual petroleum hydrocarbons that have migrated via groundwater flow from the former UST area.

The migration of TPH and chlorinated VOCs at the Site is interpreted to occur as a result of shallow groundwater flow. However, natural processes such as adsorption, dispersion, and natural degradation are expected to limit the horizontal and vertical extent of TPH and chlorinated VOCs. The primary source of the contaminants, leaks associated with discharges of TPH and chlorinated VOCs from the UST systems, have been terminated. Therefore, the only remaining sources are interpreted to be the affected soil beneath and downgradient of the USTs. As previously described

in Section 1.1, the entire Site is covered with concrete or asphalt/concrete (A/C) pavement. Therefore, there is currently no direct access to the affected soil.

3.1.2 Contaminant Migration Pathways

TPH tends to sorb to soil particles and can be transported from surface soils at the Site via dust generation or in surface water runoff. VOCs detected at the Site (e.g., chlorinated solvents or gasoline-range petroleum hydrocarbons) would not be expected to be present in surface soils, but can migrate downward from shallow soils to deeper soils under the force of gravity. VOCs could also migrate upward in soil vapor to indoor or outside air. In addition, these types of chemicals can migrate to underlying groundwater through leaching. Dissolved chlorinated solvents and petroleum hydrocarbons can also migrate with groundwater flow.

3.1.3 Potential Receptors and Exposure Pathways

The Site and surrounding areas are currently zoned for commercial/industrial use and they are expected to remain as such in the future. Therefore, the following receptors include:

- Hypothetical On-Site Outdoor Commercial/Industrial Worker Receptor (current and future exposure scenario);
- Hypothetical On-Site Indoor Commercial/Industrial Worker Receptor (current and future exposure scenario), and;
- Hypothetical On-Site and Off-Site Outdoor Construction Worker Receptor (current and future exposure scenario).

The exposure pathways assumed to be complete and significant for the hypothetical On-Site outdoor commercial/industrial and On-Site and Off-Site construction worker receptors include:

- Ingestion of soil;
- Dermal contact with soil; and
- Inhalation of dusts/vapors in outdoor air generated from soil and groundwater.

4.0 SITE MANAGEMENT ACTIVITIES

4.1 General

No excavation work shall be conducted at the Site, unless expressly permitted in writing by the ACEH. Any contaminated soils brought to the surface by grading, excavation, trenching, or backfilling shall be managed by the Site or his agent in accordance with all applicable provisions of local, state and federal law. Notwithstanding the foregoing, the Site may perform routine landscaping and maintenance of improvements thereon.

All uses and development shall preserve the integrity of any cap, any remedial measures taken or remedial equipment installed, and any groundwater monitoring system installed on the Site pursuant to the requirements of the ACEH, unless otherwise expressly permitted in writing by the ACEH. No additional buildings or other subsurface structures are to be constructed without the approval of ACEH.

With the exception of the existing onsite water supply well, no Owners or Occupants of the Site or any portion thereof shall drill, bore, otherwise construct, or use a well for the purpose of extracting water for any use, including but not limited to, domestic, potable, or industrial uses, unless expressly permitted in writing by the ACEH.

The Site shall notify the ACEH of each of the following: (1) The type, cause, location and date of any disturbance to any cap, any remedial measures taken or remedial equipment installed, and of the groundwater monitoring system installed on the Site pursuant to the requirements of the ACEH, which could affect the ability of such cap or remedial measures, remedial equipment, or monitoring system to perform their respective functions and (2) the type and date of repair of such disturbance. Notification to the ACEH shall be made by registered mail within ten (10) working days of both the discovery of such disturbance and the completion of repairs.

4.2 Soil Management

Soil management during construction addresses precautions that will be taken to mitigate risks to human health and the environment from identified chemicals during future redevelopment and/or intrusive activities at the Site such as soil excavation, trenching, new construction, site development, grading and utility repair. These precautions will include the following:

- Implementation of construction impact mitigation measures, including control of dust generation at the Site, decontamination of equipment, and prevention of storm water runoff; and

- Establishment of procedures to: (1) manage soil and groundwater on the Site during construction and (2) characterize soil if it is found to contain concentrations of TPH, VOCs , or metals in excess of State of California hazardous waste criteria or ESLs for commercial land use.

4.3 Site Specific Health and Safety Plans

During all activities involving disturbance of the surface cap or subsurface excavation, those workers that may directly contact soil or groundwater containing constituents of concern (VOCs, petroleum hydrocarbons, and metals) will perform these activities in accordance with a site-specific health and safety plan. The plan will be consistent with State and Federal Occupational Safety and Health Administration ("OSHA") standards for hazardous waste operations (CCR, Title 8, Section 5192 and 29 Code of Federal Regulations 1910.120, respectively). Among other things, the health and safety plan will include a description of health and safety training requirements for onsite construction workers, a description of the level of personal protective equipment to be used, if any, air quality monitoring plans, and any other applicable precautions to be undertaken. The health and safety Plan shall include procedures for handling soil and/or groundwater contaminated with VOCs, petroleum hydrocarbons, and/or metals.

4.4 Soil Management Protocols

Soil management protocols described in this section provide guidance for excavating and handling soil at the Site. The specific protocols to be followed when managing soil on the Site are summarized below:

- If soil is to be disposed offsite then sampling frequencies and test methods employed to characterize the soil will be determined by the disposal facility accepting the soil.
- If soil is to remain at the Site it must be tested to determine if TPH, VOCS, and metals are less than the appropriate screening levels for reuse.
- Testing of soil for reuse can be performed: (1) in advance of excavation by collecting soil samples from soil borings installed to the depth of the intended excavation or (2) during excavation by sampling excavated soil as stockpiles are being formed.

4.4.1 Soil Testing and Analytical Protocol

Soil intended for reuse will be sampled at an appropriate frequency in accordance with the Department of Toxic Substances Control (DTSCs) Information Advisory Clean Imported Fill Material (Advisory), dated October 2001 (DTSC 2001). A sampling grid will be established for each stockpile based on the volume of soil and minimum number of samples to be collected in accordance with DTSC's Advisory as follows:

- Stockpiles up to 1,000 cubic yards: 1 sample per 250 cubic yards.
- Stockpiles from 1,000 to 5,000 cubic yards: 4 samples for first 1000 cubic yards plus 1 sample per each additional 500 cubic yards.
- Stockpiles greater than 5,000 cubic yards: 12 samples for first 5,000 cubic yards plus 1 sample per each additional 1,000 cubic yards.

Stockpile samples will be collected by removing the surface soil (approximately 6-inches) followed by inserting a brass or stainless steel tube into the soil. Each sample container will be labeled, sealed, and placed on ice in a cooler. Samples will be transmitted under chain-of-custody procedures to a State of California certified laboratory. Soil samples will be analyzed for TPH, VOCs, and metals using EPA Methods 8015M, 8260B, and 6010. Soil samples that exceed ten times their respective soluble threshold limit concentration (STLC; metals) will also be analyzed using the waste extraction test (WET) to further assess the re-use of soil onsite. Soil that exceeds the STLC or commercial ESL will be disposed of offsite at an appropriate disposal facility.

Additional soil samples may also be collected from the stockpiled soil to aid in disposal. Soil samples in stockpiles will be collected at a frequency that is required by the disposal facility (landfill). Samples will be analyzed for additional analytes as required for disposal.

4.4.2 Handling Procedures for Contaminated Soil

The following handling procedures shall be followed during excavation activities.

- Any stockpiled soil shall be covered with plastic sheeting or tarps and will not be stockpiled in or near storm drains.
- Access to excavated areas shall be controlled to prevent unauthorized persons accessing exposed soil.
- Soil determined to be hazardous waste shall be disposed of offsite. Soil shall be transported under applicable U.S. and California Department of Transportation regulations. Current federal and state requirements should be reviewed prior to disposal of soil.

4.5 Handling Procedures for Contaminated Groundwater

VOCs and TPH at levels above ESLs have been detected in groundwater samples from the Site. Therefore, if any excavation activities require dewatering, water shall be stored in holding tanks and sampled in accordance with applicable laws and regulations for disposal.

Any project-related water associated with dewatering activities shall either discharge into the sanitary sewer, under permit with East Bay Municipal Utility District (EBMUD), or comply with the National Pollutant Discharge System (NPDES) permit regulations and an associated Storm Water

Pollution Prevention Plan (SWPPP) regarding discharge into storm drains. Such permit requirements typically include on-site treatment to remove pollutants prior to discharge. Alternatively, the water shall be temporarily stored onsite in holding tanks, pending off-site disposal at an approved disposal facility.

4.6 Minimizing Soil and Groundwater Contact by Construction Workers

There are potential health and safety risks associated with the petroleum hydrocarbons, VOCs, and metals detected in Site soils, as well as petroleum hydrocarbons and VOCs detected in groundwater. There is the potential for contact by construction workers with residual chemicals in soil at the Site. The routes of potential exposure to the petroleum hydrocarbons, VOCs, and metals in soil are: dermal (skin) contact with the soil; (2) inhalation of dusts; and (3) ingestion of the soil.

Groundwater occurs on-Site at a depth of 3 to 8 feet bgs. There is the potential for contact by construction workers with residual chemicals in groundwater at the Site. The routes of potential exposure to the petroleum hydrocarbons and VOCs in groundwater are: (1) dermal (skin) contact with groundwater; and (2) inhalation of emissions from exposed water. The greatest potential for human exposure to the petroleum hydrocarbons and VOCs in water will be during soil excavation operations and dewatering activities.

The abovementioned health risks to on-Site construction workers will be minimized by developing and implementing a site-specific health and safety plan. The Site Environmental Manager or representative overseeing removal actions will be responsible for establishing and maintaining proper health and safety procedures to minimize construction worker exposure to Site contaminants. At minimum, the site-specific health and safety plan will include: (1) health and safety training requirements for on-Site personnel; (2) personal hygiene and monitoring equipment to be used during construction to protect and verify the health and safety of the construction workers; (3) additional precautions to be undertaken to minimize direct contact with hazardous substances, including implementation of dust control measures; and (4) a description of the procedures to mitigate any potential health risk to bystanders during subsurface activities.

A Site health and safety officer (HSO) or designee will be on-Site during excavation activities to ensure that all health and safety measures are maintained. The HSO will have the authority to direct and, if necessary, stop all construction activities in order to ensure compliance with the site-specific health and safety plan.

4.7 Site Control

Access to the work zones where soil will be disturbed shall be controlled using caution tape, cones, fencing, steel plates, or other measures to clearly designate the active work area and to prevent access by the public. To minimize the migration of contaminated soils from the Site to

uncontaminated areas, excavated soil shall be covered and secured by temporary fences or other means to prevent unauthorized access.

4.8 Dust/Vapor Control Measures

Dust control measures will be implemented during construction activities at the Site to minimize the generation of dust. Dust generation that will be mitigated includes that associated with excavation activities, truck traffic, ambient wind traversing soil stockpiles, and loading of transportation vehicles.

Dust generation will be minimized using appropriate measures. These measures include but are not limited to the following:

- Mist or spray water while performing excavation activities and loading transportation vehicles;
- Limit vehicle speeds on the property to 5 miles per hour;
- Control excavation activities to minimize the generation of dust;
- Minimize drop heights while loading transportation vehicles; and
- Cover soil stockpiles, if present, with visqueen or tarps.

If the construction area is greater than 4 acres, use enhanced control measures as specified in Table 2 of the BAAQMD California Environmental Quality Act Guidelines (BAAQMD, 1999).

4.9 Decontamination

Decontamination procedures shall be developed by contractors to minimize the equipment contamination during excavation activities. The procedures should include removing loose soil from the vehicle exterior using dry methods, such as brushing, scraping or vacuuming. Soil not removed by dry methods, should be cleaned by pressure washing or steam cleaning. Water collected from the cleaning process should be sampled prior to disposal.

4.10 Monitoring Wells

All groundwater monitoring wells located onsite shall be protected during excavation and construction activities. A map showing the locations of wells currently on the property are shown on Figure 2. Any damage to these wells should be reported immediately. All the wells should be accessible to others during excavation and construction activities. Prior to removal or relocation of any wells, the ACEH shall be notified and well destruction or installation permits shall be obtained from Alameda County Department of Public Works.

4.11 Storm Water Control

Storm water pollution controls shall be implemented by construction contractors to minimize sediment runoff in storm water, which could include soil containing contaminants of concern. Prior to the initiation of the work, the contractors must follow the requirements of the CRWQCB general permit and other permits by the CRWQCB. Storm water pollution controls implemented at the Site will be based on best management practices, such as those described in the "Information on Erosion and Sediment Controls for Construction Projects: A Guidebook," Erosion and Sediment Control Field Manual (CRWQCB, 2002), and the Storm Water Best Management Practices Handbook (CSQA, 2003).

Procedures to prevent erosion and sediment runoff from the Site shall include grading the Site, installing storm water control devices such as temporary earth berms or erecting silt fences around the perimeter of exposed soil at the Site. Straw bale barriers or sediment traps are required to protect the existing catch basins.

4.12 Reporting

After earthwork activities are complete, a report will be prepared to document the relocation and final disposition of soil reused or disposed of offsite. At a minimum, the report will include the dimensions of the excavation and confirmation sample locations. The analytical data will be provided in tables and a Site plan showing sampling locations and limits of excavation and grading will be presented. If applicable, copies of receipts pertaining to the disposition of the soil will be appended to the report.

5.0 CONTINGENCY PLAN

The following contingency plan shall be implemented to address unknown contamination during grading, trenching, and dewatering activities:

- All grading, trench excavation and filling operations, and dewatering operations shall be observed for the presence of free-phase petroleum products, chemicals, or contaminated soil/groundwater. Discolored soil or suspected contaminated soil shall be segregated from clean soil. In the event unexpected, contaminated soil or groundwater is encountered during construction, the contractor shall notify Site Environmental Manager. The Site Environmental Manager shall confirm the presence of the suspect material and direct the contractor to remove, stockpile or contain, and characterize the suspect material(s) identified within the boundaries of the construction area. Continued work at a contaminated site shall require the approval of the Site Environmental Manager.
- A photoionization detector (or other organic vapor detecting device) shall be present during grading and excavation through suspected chemically impacted soil.
- Excavation of VOC-impacted soil will require obtaining and complying with a Bay Area Air Quality Management District Rule 40 permit.
- The extent of removal actions shall be determined on a site-specific basis. At a minimum, the chemically impacted area(s) within the boundary of the construction area and/or trench shall be remediated to the satisfaction of the lead regulatory agency (ACEH) for the site. The Site Environmental Manager or representative overseeing removal actions shall inform the contractor when the removal action is complete.
- In the event that contaminated soil is encountered, all on-site personnel handling or working in the vicinity of the contaminated material shall be trained in accordance with OSHA regulations for hazardous waste operations. These regulations are based on CFR 1910.120 (e) and 8 CCR 5192, which states that "general site workers" shall receive a minimum of 40 hours of classroom training and a minimum of three days of field training. This training provides precautions and protective measures to reduce or eliminate hazardous materials/waste hazards at the work place.
- All excavations shall be filled with structurally suitable fill material which contains non-hazardous contaminant concentrations (if any) that do not exceed ESLs. The cover (cap) shall be repaired and returned to its pre-excavation condition.
- Any project-related dewatering activities shall either discharge into the sanitary sewer, under permit with the EBMUD, or comply with the NPDES permit regulations and an associated SWPPP regarding discharge into storm drains. Such permit requirements typically include on-site treatment to remove pollutants prior to discharge. Alternatively, the

water shall be temporarily stored onsite in holding tanks, pending off-site disposal at an approved disposal facility.

- The Site Environmental Manager shall confirm the presence of the suspect contaminated soil and direct the contractor to remove, stockpile, or contain the suspect material identified within the boundaries of the construction area. Contaminated soil shall either be treated on-site or trucked off-site for disposal at a California licensed facility approved for disposal of such waste.
- After earthwork activities are complete, a report will be prepared to document the relocation and final disposition of soil reused or disposed of offsite. At a minimum, the report will include the dimensions of the excavation and confirmation sample locations. The analytical data will be provided in tables and a Site plan showing sampling locations and limits of excavation and grading will be presented. If applicable, copies of receipts pertaining to the disposition of the soil will be appended to the report.

5.1 Implementation of Site Management Plan

AB&I shall oversee implementation of this SMP at the Site. A copy of this SMP shall be included in all contracts signed with contractors and third party contractors working in the subsurface at the Site. It is the responsibility of the contractor to adhere to this SMP, project specifications, and site safety. The contractor is also responsible for providing a copy of this SMP to its subcontractors.

This SMP was developed based on the current conditions at the Site and applicable regulations. It may be necessary to modify this SMP from time to time for any of several reasons, including the following.

- Change in property use (e.g., addition of buildings to the site);
- Any change in legal requirements;
- Change in environmental conditions;
- Intrusive activity that is not addressed by this SMP; and
- New chemical toxicity information for chemicals present at the Site.

5.2 Limitations

This SMP was prepared to address VOCs, TPH and metals present in the soil and groundwater at the Site and current known site conditions, regulations and laws. This SMP does not address issues related to other chemicals or future site conditions that may be encountered during construction projects, including but not limited to, demolition and construction debris, asphalt, concrete, and asbestos-containing materials. If such materials are encountered during a

construction project, contractors and workers are responsible for complying with all applicable laws pertaining to the handling and disposal of these materials.

The Site-related activities may be subject to federal, state, and local laws and regulations, including those published by U.S. Environmental protection Agency (USEPA), the BAAQMD, California Environmental Protection Agency (Cal-EPA), Alameda County, and the City of Oakland. These regulations address issues such as health and safety, hazardous waste, dust generation, storm water, and community right-to-know. It is the responsibility of the parties involved to ensure that all construction and maintenance activities abide by current applicable laws and regulations.

SGI disclaims any responsibility for any unauthorized use of this SMP. It is understood that while this SMP is intended to provide guidance and establish a framework for the management of residual product in the subsurface in soil to protect human health and the environment, this SMP shall not create any warranties or obligations to AB&I as to implementation, adequacy, or success of protective measures under this SMP.

Notes:

MTBE - Methyl tert butyl ether
(mg/kg) - milligrams per kilogram
TPHg - Total Petroleum Hydrocarbons as Gasoline
TPHd - Total Petroleum Hydrocarbons as Diesel
<0.005 - Not reported at or above laboratory's reporting limit of 0.005 mg/kg
UST - underground storage tank
1,1,1-TCA - 1,1,1-Trichloroethane

-TPHg, BTEX, VOCs and fuel oxygenates analyzed using EPA Method 8260B by Test America Laboratories (TAL), Pleasanton, California

-TPHd analyzed using EPA Method 8015M with silica gel cleanup by TAL, Pleasanton, California

RWQCB ESLs - Environmental Screening Levels taken from the California Regional Water Quality Control Board, San Francisco Bay Region document entitled "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater," Interim Final November 2007, groundwater is not a current or potential source of drinking water.

-Concentrations in bold exceed commercial ESLs for shallow soil (less than 3 meters).

Notes:
Value in bold exceed the MCL
Shaded values exceed the ESL for vapor intrusion
* California Department of Health Drinking Water Program, Drinking Water Notification Level, December 14, 2007

MCL	=	California EPA Department of Health Service Maximum concentration levels for drinking water
RWQCB ESLs (VI)	=	Regional Water Quality Control Board Environmental Screening Levels based on vapor intrusion concerns for commercial land use scenario.
ug/L	=	All concentrations reported in micrograms per liter (ug/L).
TPH	=	Total Petroleum Hydrocarbons
MTBE	=	methyl tert butyl ether
ETBE	=	ethyl tert butyl ether
TAME	=	tert-amyl methyl ether
DIPE	=	diisopropyl ether
TBA	=	tributyl alcohol
DCA	=	dichloroethane
ND	=	Not detected at or above laboratory reporting limit.
<50	=	Not detected at or above laboratory reporting limit of 50 ug/L.
NS	=	Not sampled.
--	=	Not analyzed.
*500	=	Reported due to the presence of discrete peaks
J	=	analyte detected below quantitation limits

MANAGEMENT APPROVAL

I Michael Lowe, having the authority to commit the necessary resources to fully implement this SPCC Plan, give full approval to this SPCC Plan. By signature below, I approve and acknowledge that the elements identified within this SPCC Plan have been implemented as required by 40 CFR §112.7.

In addition, this certification constitutes a written commitment of manpower, equipment, and materials required to expeditiously control and remove any quantity of oil discharged that may be harmful.

REGISTERED PROFESSIONAL ENGINEER CERTIFICATION

I certify as a Registered Professional Engineer that I am familiar with the requirements of 40 Code of Federal Regulations Part 112 (40 CFR Part 112) – Oil Pollution Prevention (the CWA, OPA, and 40 CFR Part 112 are sometimes collectively referred to as, the Regulations); that I, or my agent, have visited and examined the ABI Foundry (the Facility); that this Spill Prevention, Control, and Countermeasure (SPCC) Plan has been prepared in accordance with good engineering practice, including consideration of applicable industry standards, and with the requirements of the Regulations; that procedures for required inspections and testing have been adequately established; and that the SPCC Plan is adequate for the Facility. This certification shall in no way relieve the owner/operator of the Facility of its duty to fully implement this SPCC Plan in accordance with the requirements of 40 CFR Part 112.

March, 2016	Sage Environmental	Minor inventory changes. Changed description of sump operations. PE Certification
September, 2016	Sage ATC Environmental / ABI	Added compressor blowdown totes and mold release drum. PE Certification
May, 2017	Sage ATC Environmental	Add Oil Building, add Pattern Shop compressor oily water drum.
November, 2017	Sage ATC / ABI	Updated Table 2-1, and 2-2 to address minor changes. Added metal chip containers.
March 2019	Sage ATC/ABI	Updated Table 2-2 to address minor changes. Administrative changes. PE certification
April 2020	Sage ATC/ABI	Updated Table 2-2, section 5.3.1,section 5.3.4, section 5.7, appendix C, and figure 2.3 to address minor changes.

SECTION 1
INTRODUCTION

This Spill Prevention, Control, and Countermeasure (SPCC) Plan (SPCC Plan) has been prepared for ABI Foundry (ABI) located at 7825 San Leandro Street, Oakland, Alameda County, California, (referenced to herein as the Facility) in accordance with the Clean Water Act (CWA), the Oil Pollution Act of 1990 (OPA), and 40 CFR Part 112 – Oil Pollution Prevention (the CWA, OPA, and 40 CFR Part 112 are sometimes collectively referred to herein as the Regulations). This SPCC Plan conforms to the applicable requirements of the Regulations as revised. This SPCC Plan has also been designed to comply with the California Aboveground Petroleum Storage Act (APSA). ABI Foundry is required to prepare and implement this SPCC Plan because it stores, or otherwise uses, oil in an aggregate capacity greater than 1,320 gallons above ground storage.

1.1 Purpose of the SPCC Plan

The purpose of this SPCC Plan is to identify possible factors and events that can lead to the discharge of oil into or upon navigable waters of the United States; establish guidelines for the control and disposal of spills and spill material upon discharge; and outline the oil storage and use at the Facility and engineering designs implemented to prevent and mitigate oil discharges.

1.2 SPCC Plan Availability

A complete copy of this SPCC Plan shall be maintained at the Facility at all times and be available for on-site review during normal working hours.

1.3 SPCC Plan Amendment

1.3.1 Changes in Facility Configuration

In accordance with 40 CFR §112.5(a), the Facility periodically reviews and evaluates this SPCC Plan for any change in the Facility design, construction, operation, or maintenance that materially affects the Facility's potential for an oil discharge, including, but not limited to the following:

- Commissioning of containers;
- Reconstruction, replacement, or installation of piping systems;
- Construction or demolition that might alter secondary containment structures; and
- Changes of product or service, revisions to standard operation, modification of testing/inspection procedures, and use of new or modified industry standards or maintenance procedures.

Amendments to the SPCC Plan made to address changes of this nature are referred to as technical amendments, and must be certified by a Professional Engineer.

Non-technical amendments can be done and documented on the Review and Amendment Summary Table. Non-technical amendments include, but are not limited to, the following:

- Changes in name or contact information (i.e., telephone numbers) of individuals responsible for the implementation of this SPCC Plan; and
- Changes in the name or contact information of spill response or cleanup contractors.

The Facility must make the needed revisions to the SPCC Plan as soon as possible, but no later than six (6) months after the change occurs. The SPCC Plan must be implemented as soon as possible following any technical amendment, but no later than six (6) months from the date of the amendment. The amendment should be summarized on the amendment summary form on Page x of this plan.

1.3.2 Scheduled SPCC Plan Reviews

40 CFR 112.5(b) requires the SPCC Plan to be reviewed and evaluated at least once every five years. However, per corporate policy, this SPCC Plan will be reviewed and evaluated annually. The review should be documented and signed on the form presented on Page ix of this document. As a result of this review and evaluation, the SPCC Plan must be amended within six months of the review to include more effective prevention and control technology if the technology has been field-proven at the time of the review and will significantly reduce the likelihood of a discharge. Revisions to the SPCC Plan, if needed, will be made within six months of the review. A registered Professional Engineer will certify any technical amendments to the SPCC Plan, as described above, in accordance with 40 CFR §112.3(d).
#
Note that any technical amendment to this SPCC Plan must be certified by a Registered Professional Engineer.

1.4 Amendment by Regional Administrator

In the event that the Facility experiences a discharge of 1,000 gallons of oil in a single discharge, or discharges 42 gallons of oil in each of two discharges during any twelve month period, the information in Appendix B must be submitted to the United States Environmental Protection Agency (U.S. EPA) Regional Administrator. Subsequently, the SPCC Plan may be required to be amended within 30-days of notice from the U.S. EPA Regional Administrator. The amended SPCC Plan must be implemented as soon as possible, but not later than within six months of the amendment.

The SPCC Review and Amendment Summary are provided on Pages ix and x of this SPCC Plan.

Note that any technical amendment to this SPCC Plan required as a result of an oil discharge as described above must be certified by a Registered Professional Engineer.

1.5 Conformance with Other Regulations

The State of California has spill prevention control and countermeasures regulations. In 2007, APSA amended the California Health and Safety Code Section 25270. The Facility has storage tanks containing oil with capacities of 10,000 gallons or more, and therefore is subject to the inspection (§25270.5) and registration (25270.6) requirements of APSA. The inspection

requirements are addressed in Section 5.7 of this Plan. The ABI Foundry submits to its Certified Unified Program Agency (CUPA) for the area, which is the Alameda County Department of Environmental Health (ACDEH), a Business Plan, as defined in §25501(e) which satisfies the registration requirement of §25270.6. Commencing in calendar year 2010, CUPA may establish a fee at a level sufficient to pay the necessary and reasonable costs incurred by CUPA in administering the California SPCC requirements of §25270.4.

1.6 Equivalent Environmental Protection

As provided in 40 CFR 112.7(a)(2), the SPCC Plan may deviate from the non-secondary containment requirements of the regulation if equivalent environmental protection is provided by other means of spill prevention, control, and countermeasure. The Facility does not deviate from any non-secondary containment requirements of the SPCC Regulation, so no environmental equivalence determinations have been made in this SPCC Plan.

SECTION 2
GENERAL FACILITY INFORMATION

2.1 Facility Information and Contacts

Name of Facility: ABI Foundry
Location of Facility: 7825 San Leandro Street, Oakland, CA 94621
Phone/ Fax: 510- 623-3467 / 510-632-8035
Latitude: 37° 44' 59" Longitude: -122° 11' 38"

Primary Contact

Name: Dale Darling
Title: Plant Manager
Phone: 510-632-3467
Mobile: 510-206-6048

Secondary Contact:

Name: Melisa Cohen
Title: Environmental Manager
Phone: 510-633-5224
Mobile: 510-332-3569

Emergency Response – Primary
Accountable for Discharge Prevention

Name: Melisa Cohen
Title: Environmental Manager
Phone: 510-633-5224
Mobile: 510-332-3569

Emergency Response – Alternate

Name: Rich Watson
Title: VP of operations
Phone: 510-632-3467
Mobile: 510-502-4896

Other Key Contacts

Stockroom: 510-633-5235 or radio
Safety Kleen: 510-335-5255 (Oil vacuum services – spill cleanup contractor)

2.2 Facility Location and Layout

The Facility is located at 7825 San Leandro Street, Alameda County, Oakland, California, south of the intersection of San Leandro Street and Hegenberger Expressway. The Facility is designated by Standard Industrial Classification (SIC) Code 3321 and North American Industrial Classification System (NAICS) Code 331511.

A site location map that identifies the ABI Foundry in relation to the surrounding area is provided as Figure 2-1. Figure 2-2 is an aerial view of the Facility. Figure 2-3 is a diagram that shows the Facility plot plan, locations of oil storage and use, and indicating the direction of storm water flow.

2.3 Facility Operations

ABI operates an iron foundry in Oakland, California for the production of cast iron in the manufacturing of drain-waste-vent (DWV) fittings. Iron scrap is melted in a cupola furnace and the molten metal is transferred to an electric induction holding furnace before being poured into molds. ABI has several buildings and indoor/outdoor work areas with various operational and process support equipment. ABI has an emergency diesel generator, compressors, process equipment containing liquid asphalt, portable equipment, trash compactors, and an oil storage area.

2.4 Facility Oil Storage and Use

The Facility stores asphalt, diesel, oil, gasoline, resins, and other oils in above-ground storage tanks, portable holding tanks, and 55-gallon drums. Bulk oils, drums, and portable containers are delivered via truck. Table 2-1 summarizes the bulk oil storage containers at the Facility. There are no buried or partially buried storage tanks at the Facility.

Oil filled electrical, operating, and manufacturing equipment at the Facility includes hydraulic oil reservoirs on various machines, electrical transformers, and asphalt dip tanks. Table 2-2 summarizes the oil containing equipment at the Facility.

Oil contained in motor vehicles in parking areas are not addressed in this SPCC Plan because the Oil Pollution Prevention rules are not generally applicable to motive power containers pursuant to 40 CFR §112.1(d).

Several products stored in small tanks and portable containers, such as paints and mold release compounds, were included in previous versions of this SPCC Plan. However, based on a review of the specifications of these materials, they are not considered oil or petroleum products as defined by the regulations, and are no longer included in this document.

Table 2-1
Bulk Storage Containers

Map ID	Location	Contents	Capacity (Gallons)	Direction of Flow (Direction if Secondary Containment Fails)	Secondary Containment Capacity (Gallons)

*Heat transfer oil system includes the oil reservoir and approximately 450 feet of 2-inch piping.

2.5 Facility Drainage

The entire Facility is paved with either concrete or asphalt. The integrity of the concrete and asphalt appears to be in good condition with slight surface cracking and minor deterioration. Containment curbs are located around the emergency generator and the liquid asphalt storage tanks. As discussed in Section 5.3, some containers are of double-walled construction or have secondary containment provided by individual berms.

Surface drainage at the Facility (generally to the southwest) flows into three storm water collection sumps, as shown in Figure 2-3. Level-controlled pumps in the sumps transfer accumulated storm water into a storm water collection and treatment system (SWS) located near Sump No. 1. Two additional storm drains have also been equipped with sump pumps to transfer storm water to the SWS. This system includes settling tanks, flocculent injection, and filters to remove contaminants from the water prior to discharge. The system has been designed to collect

and treat 90 percent of the storm water from a 25-year, 24-hour storm event. A process flow diagram and equipment layout diagram for the SWS are shown in Appendix E.

During periods of dry weather, the storm water sumps (shown on the site map, Figure 2-3, as Sump No. 1, Sump No. 2, and Sump No. 3) are kept free of water. The pumps that transfer water to the storm water treatment system are placed in the Off position. Therefore, the full volume of each sump is available to provide containment in the event of a spill.

During rainstorms and periods of frequent wet weather, the Facility does not typically pump out the sumps. The appropriate compartments of the sumps remain filled with water, and baffles and other flow control systems in the sumps cause the sumps to function as oil/water separators (OWS). Figures 2-4 through 2-6 illustrate the design and operation of Sumps No. 1, 2, and 3 when operating as oil/water separators. In this configuration, the containment capacity of the sump is the quantity of oil that can be retained within the oil-collection portion of the OWS without flowing into the storm drain. When weather forecasts indicate that no additional rain is expected for a period of time, the water is either pumped into the SWS or is used in the process, as appropriate.

Table 2-3 presents the containment volume of each sump in each configuration. The largest bulk storage container (without its own engineered secondary containment) draining to each sump is also shown in the table.

Table 2-3
Drainage Sump Capacities

Sump No.	Capacity When Empty (Gallons)	Capacity When Contain Water (Gallons)	Capacity of Largest Bulk Storage Container Draining to Sump (Gallons)	
1	13,500	3,700	Pressure Wash Tank.	375
2	2,700	500	Fitting Dip Tank	275
3	2,160	990	Mist Eliminator	275

It should be noted that in the event of a very heavy storm, the sumps have overflows to allow excess water to discharge directly to surface water. However, the sump would continue its function as an oil/water separator, any oil spilled concurrently would likely be retained within the sump.

In addition to the three storm water sumps, there are two other sumps that could receive spilled oil, but that have no discharge path to surface water.

The cooling water sump, which is known as the Contact Sump, collects contact cooling water from the Facility's process equipment for processing in the Facility's wastewater treatment system. Neither the sump, nor the water treatment system, has any discharge to surface water or the sanitary sewer; all water entering the sump is treated and returned to the process, and makeup city water is added as necessary. The sump has a total capacity of approximately 4,000 gallons. If the water in one of the storm water sumps contains oil, it may be transferred to the Contact Sump for treatment and use in the process.

An additional sump was formerly used as one of the storm water sumps until it was replaced by the current Sump No. 3 in 2011. This sump, located beneath the Facility's cooling tower, does not currently have an outlet to surface water. Any oil or water that collects in this sump is pumped to the Contact sump for treatment and use in the process.

There is one additional sump that does have a potential path to surface water. Sump No. 8, located near Special Finishing in the Northwest portion of the property, receives drainage from the paved area outside the Pattern Shop and Special Finishing buildings. This sump is small, with a capacity of approximately 100 gallons. A sump pump is located within the sump. The pump is manually activated and pumps the water to Sump No. 1. In most circumstances, all of the water entering this sump enters Sump No. 1, and there is no discharge from this drainage area to surface water.

However, there is an overflow weir in the sump that enters a pipe that discharges to surface water. In periods of very heavy flow, or if the pump is not turned on, the water would exit the facility. Therefore, this sump is not used as secondary containment in the manner of Sumps #1, 2, and 3. There are no bulk storage containers in this drainage area, only several pieces of oil-filled equipment. See Section 5.2 for information on containment with respect to these items.

SECTION 3
PREDICTION OF POTENTIAL SPILLS AND RELEASES

Potential spill events, expected volumes, and expected rates at the Facility are provided on Table 3-1 and further discussed below.

Table 3-1
Potential Oil Releases

Potential Spill Event	Maximum Catastrophic and Reasonably Anticipated Spill Volumes	Estimated Spill Rate
Complete failure of asphalt storage tank	Maximum of 10,000 gallons	Instantaneous into secondary containment berm
Partial failure or overfilling of asphalt, diesel, or other oil storage tank	Up to 120 gallons	Instantaneous into secondary containment berm
Partial or complete failure of an asphalt dip tank	Up to 500 gallons	Gradual to instantaneous onto concrete manufacturing area toward drainage collection system
Partial failure of facility oil transfer piping, valves, or pump packing	Up to 200 gallons	Gradual to instantaneous onto concrete manufacturing area toward drainage collection system
Partial failure of hydraulic oil reservoirs on machines or hot oil heating/recirculation system	Up to 10 gallons	Gradual to instantaneous onto concrete manufacturing area toward drainage collection system
Transfer accident of diesel or other oil transferred into storage tanks	Less than 10 gallons	Instantaneous onto concrete/asphalt paved area toward drainage collection system
Partial failure or leak from transformer	Less than 10 gallons	Gradual to instantaneous onto concrete/asphalt paved area toward drainage collection system
Partial or complete failure of oil storage drum	55 gallons or less	Gradual to instantaneous into containment structure or sump

3.1 Hot Asphalt Storage Tanks

The Facility has two jacketed 10,000-gallon hot asphalt storage tanks located near the Wastewater Treatment Plant Area that are used to supply process holding tanks for the hot dip process at the Pipe Machines. These tanks are enclosed within a secondary containment dike that provides the primary physical control of a discharge resulting from failure of the primary tank. The containment dike has a capacity of 18,000 gallons, which is sufficient to contain the contents of one tank plus accumulated precipitation. If the containment failed during a release, the oil would enter a storm drain and flow to Sump No. 3.

A potential release scenario may occur during the delivery and use of liquid asphalt. The asphalt tanks are filled approximately three times a month. There is a potential for spillage during

offloading activities from the vendor as well as transfer to the dip tanks. Efforts are made to prevent spillage by using written transfer procedures, incorporating secondary containment, and having spill equipment readily available. Any spilled or leaked material would likely solidify before flowing from the area, but any material that did flow would drain into Sump No. 3.

The asphalt in these tanks is maintained in a liquid state using a heat transfer oil. The heat transfer oil is heated in a gas-fired furnace, and the oil is recirculated through an insulated jacket on the oil tanks. The heat transfer system is oil-filled operational equipment. Any oil that leaked or spilled from this system would flow into Sump No. 3.

3.2 Diesel Storage

The diesel storage tanks for the emergency generator and the ConVault #1 and #2 are double-walled tanks. This provides the primary physical control of a discharge resulting from tank failure, where a failure of the inner tank wall would lead to a release contained by the outer tank wall. If the outer wall also failed, oil from ConVault #1 would flow to Sump No. 1 and ConVault #2 would enter a storm drain and flow to Sump No. 3.

The most reasonable potential release scenario considered for the bulk diesel tanks is spillage during transfer of diesel fuel from a fuel delivery truck to the aboveground tanks via the tank fill lines or from the bulk tanks to Facility equipment or portable tanks.

The ConVault 1,000 gallon diesel tanks are filled by a contractor. In the event that a connection fails, or the hose ruptures while pumping, the driver filling the tank should be able to stop the flow of fuel using the emergency shut-off function within 15 seconds. Given this average pump rate of 80 gallons per minute for fuel delivery, and an assumed worst-case scenario of 1.5 minutes for shut-off, the maximum fuel spill is approximately 120 gallons. The ConVaults tanks have secondary containment and any spillage would be captured in the interstitial space.

The bulk diesel tanks are used to fill miscellaneous equipment on site, including mobile equipment, and there is an opportunity for spills to occur with the loading of equipment from the ConVaults. The bulk diesel tank is equipped with a manual dispensing hose and nozzle with a backflow prevention device. If the nozzle disengages during transfer, the flow of diesel fuel would automatically stop.

A potential release scenario considered for the emergency generator is spillage during transfer of diesel fuel from a fuel delivery truck to the aboveground tank via the tank fill lines. In the event that a connection fails, or the hose ruptures while pumping, the driver filling the tank should be able to stop the flow of fuel using the emergency shut-off function within 1.5 minutes. The emergency generator is contained within an enclosed unit and curbed area, so any spillage would most likely be contained internally.

3.3 Small and Portable Oil Storage Containers

Any release from the two 250 gallon oil storage tanks (DISA 270 and DISA 2013) would drain via the Facility's drainage collection system to Sump No. 3.

The two containers for used oil are double walled, polyethylene tanks. Any release from the primary tank would be contained within the secondary outer wall. If the outer wall failed, oil from the used oil tank in the oil building would flow to Sump No. 1, and the tank in the pressure wash building would enter the sump in the pressure wash room.

A tote used to collect oily wash water from the pressure washer is stored within an enclosure adjacent to the pressure washer. Any oily water spilled from this tote would flow to the sump in the pressure wash enclosure, which has a capacity of 957 gallons.

Potentially oil-containing condensate water from the mist eliminator is stored in a tote adjacent to the mist eliminator. A spill would flow into Sump No. 3.

In the Core Room, one 55-gallon steel drum containing petroleum distillates, sits on a secondary containment designed for minor spills and drips. A 275-gallon tote is used to collect oily compressor blowdown. If either container were to fail the contents would drain to Sump No. 3.

Drums of lubricating and hydraulic oil are stored in the Oil Building, which has a capacity of approximately thirty (30) 55-gallon drums. The drums are stored in fabricated building, and remain closed when not in use. A flexible berm in front of the two roll-up doors, and concrete berms around the rest of the perimeter, provide approximately 560 gallons of secondary containment. In the event that the containment were to fail, the spilled oil would flow to Sump No. 1.

Several oil-filled drums are located in the Special Finishing building. Two drums of cutting oil are located on a containment pallet.

Two additional drums are located within a plastic tub. The drums have several holes punched in the bottom. Metal chips generated from machining are placed into these drums. The chips are coated with oil “coolant” from the machining process. The oil is allowed to drain from the chips into the tub. The oil is collected and returned to the operation. When they are drained of oil, the chips are recycled as scrap metal.

ABI has conservatively decided to consider this arrangement to be bulk storage. The two 55-gallon drums plus the tub have a total volume of approximately 107 gallons. A discharge from this equipment would flow to Sump No. 1.

Three 275-gallon totes and three 55-gallon containers containing the three components of a 3-part binder material are stored on saddles in the No-Bake Area. These materials contain petroleum products as part of their ingredients, and are conservatively deemed to be oil for SPCC purposes. The binder containers are mounted over a 375-gallon containment box. An uncontained release would flow into a storm drain that flows to Sump No. 2.

One 275-gallon tote containing oily condensate from compressed air separator for No-Bake molding, any release of material would drain to the cast finishing area and then pumped to Sump No. 2

3.4 Gasoline Storage

Two 55 gallon drums of gasoline are stored in a locked flammable cabinet adjacent to the Maintenance Shop. If a drum failed, the oil would flow to Sump No. 1. There is a potential for spillage from the drums to the on-site vehicles and equipment it services. The system is operated manually via a hand pump. If spillage were to occur, the operator could release the hand pump and the flow of gasoline would stop.

3.5 Asphalt Dip Tanks

Any release from the asphalt dip tank reservoirs would drain to the Wastewater Treatment Plant where it would be contained within Sump No. 3. The maximum volume spilled from an asphalt dip tank would be 500 gallons, but a more likely discharge amount would be 55 gallons or less.

3.6 Hydraulic Oil Reservoirs

Small releases (less than 10 gallons) from the Pipe Finishing equipment would be contained on the ground. Larger releases would drain via the collection trenches to Sump No. 3.

3.7 Transformers

Small releases (less than 10 gallons) from transformers would be contained on the ground near the equipment. Larger releases would drain via the collection trenches to Sump No. 2, No. 3, or No. 8.

SECTION 4
SPILL HISTORY

There have been no reportable releases of oil at the ABI Foundry within the past three years and there were no visible signs of recent releases at the time of the most recent site visit (2/9/16).

SECTION 5
SPILL PREVENTION AND CONTROL MEASURES

Spill prevention and control measures are those features and procedures implemented to prevent and control petroleum product releases due to minor leaks and spills, equipment failures, and overflows. Spill prevention measures include appropriate container and secondary containment construction, loading and unloading procedures, inspections, testing, maintenance, and site security. Spill control measures include secondary containment, team member response training, and emergency equipment.

ABI Foundry seeks to prevent the inadvertent or accidental spillage of oil from equipment through appropriate facility design features, adherence to the ABI Foundry procedures, and regular personnel training.

All oil containing equipment is overhauled on a periodic basis to minimize the likelihood of sudden failures. Liquid levels in the bulk storage tanks are monitored electronically. In addition, the bulk storage tanks are also equipped with direct vision gauges to determine liquid levels. Records of tank level measurements and equipment work-orders are maintained at the Facility.

For small leak or spill situations, sorbent materials needed to implement oil spill contingency plans are kept on site at all times. These materials are stored in the Oil Building and the Wastewater Treatment Plant.

The Facility is manned on a twenty-four hour basis. Facility equipment operators make regular rounds of the entire Facility at least twice each day. Alarms from the operating equipment are monitored both at the machines and in the Control Room. Facility equipment operators determine the cause of each alarm and an appropriate level of response will be made to any identified oil spill situation.

5.1 Container Materials and Construction

Bulk storage containers and secondary containment at the Facility are of a material and construction compatible with the oils stored within them and with their aboveground storage conditions. The ConVault diesel tanks, the used oil tanks, and the Emergency Generator diesel tank are tank-in-tank construction, compatible with their contents and with the conditions of storage, such as pressure and temperature. Other oil storage containers (55-gallon drums and bulk oil storage) are constructed of steel (with the exception of the used oil tanks), which is compatible with the contents of the containers. The used oil tanks are constructed of polyethylene, which is compatible with their contents. Similarly, oil containing equipment located at the Facility store the oil within steel compartments which is compatible with the contents stored.

5.2 General Secondary Containment

The requirements of §112.7(c) include appropriate containment and/or diversionary structures or equipment to prevent a discharge. Except for bulk storage tanks, mobile or portable containers,

and loading/unloading racks, secondary containment need only address the typical failure mode, and the most likely quantity of oil that would be discharged. Secondary containment may be active or passive.

Secondary containment for bulk storage tanks and mobile/portable containers is addressed in Section 5.3. There are no loading/unloading racks at the Facility. General secondary containment is discussed in this section.

As discussed in Section 2.5, drainage from nearly all oil storage and handling areas at the Facility drains into one of three storm sumps. As presented in Section 3, other than the failure of a bulk storage tank or portable container (which are equipped with sized secondary containment as described in Section 5.3), the largest predicted spill volume of oil is approximately 200 gallons. Therefore, in each configuration, the sumps have sufficient capacity to provide general secondary containment for any predicted loss of oil at the Facility.

The exception to the drainage configuration described above is the paved area in front of the Pattern Shop and Special Finishing building. As described in Section 2.5, this area flows to Sump No. 8, which has a potential overflow to surface water. The only oil-filled containers that drain to this sump are two machining tools in the Pattern Shop, each containing 80 gallons of cutting fluid. These machines are oil-filled operational equipment.

ABI will utilize the alternative requirements to general secondary containment for qualified oil-filled operational equipment described in §112.7(k)(2) for this equipment. The Facility has not experienced any single discharge exceeding 1,000 gallons or multiple discharges exceeding 42 gallons in a 12-month period. Thus, the machines meet the qualification criteria of §112.7(k)(1). The machines are included in the Facility's monthly visual inspection program, which will enable the Facility to detect equipment failure and/or a discharge. The spill response procedures described in Section 6 of this SPCC Plan constitute an oil spill contingency plan in accordance with 40 CFR Part 109. The Facility's commitment of manpower, equipment, and materials required to expeditiously control and remove any quantity of oil discharged that may be harmful is addressed as part of the Management Approval at the front of this SPCC Plan.

Secondary containment (or the alternative for oil-filled operational equipment described in the previous paragraph) is practicable at the Facility, and thus §112.7(d) does not apply.

5.3 Secondary Containment for Bulk Oil Storage

Per 40 CFR 112.8(c)(2) and (c)(11), fixed bulk oil storage tanks and mobile or portable oil storage containers must be provided with secondary containment sufficient for the capacity of the largest single container plus accumulated precipitation. This section discusses secondary containment for the bulk oil storage containers at the Facility.

5.3.1 Asphalt Storage

The Facility has two hot asphalt tanks located near the Wastewater Treatment Plant that are used to supply the process dip tanks at the Pipe Machines. These tanks are enclosed within secondary containment which provides the primary physical control of a discharge resulting from tank failure of the primary tank. The containment structures measures 38' x 21' x 40" to provide 18,000

gallons capacity for the contents of the largest single tank plus accumulated precipitation. Aboveground storage tanks are filled via tank truck while Facility personnel are in attendance, and are equipped with visual level gauges to prevent overfilling. Secondary containment structures have manual valves that are locked in the closed position and would be pumped out in the event of a release.

The hot oil storage tanks are jacketed and do not have internal heating coils. The heating medium is heat transfer oil rather than steam, so the potential to contaminate steam return lines is not a concern.

5.3.2 Diesel Storage Tanks

The diesel storage tanks for the emergency generator and the ConVault #1 and #2 are double-walled tanks. This provides the primary physical control of a discharge resulting from tank failure, where a failure of the inner tank wall would lead to a release contained by the outer tank wall. The ConVault tanks are equipped with level gauges to prevent overfilling. The generator tank is filled manually, providing fast response for determining the liquid level.

5.3.3 Gasoline Storage

Two 55 gallon drums are stored in a locked flammable cabinet adjacent to the Maintenance Shop. Gasoline needed for operational equipment is dispensed from a dedicated drum dispenser. Oil discharged from the gasoline drums would drain to Sump No. 1.

5.3.4 Other Oil Storage

There are two 80 gallon storage tanks that supply pattern spray oil to the DISA units. These tanks are located above floor drains that drain to Sump No. 3. These tanks are filled manually.

The Used Oil tanks are constructed of double walled, polyethylene and meet federal and California requirements for the storage of used oil. These tanks are filled manually.

The oil building is a completely enclosed storage area. This area averages approximately 30 55-gallon drums of various grades of petroleum-based motor oil, lubricating oil, and hydraulic fluid. The drums are stored within the contained structure and remain closed when not in use. A flexible berm in front of the two roll-up doors, and concrete berms around the rest of the perimeter, which measures 15’ x 30’ x 2” providing approximately 560 gallons of secondary containment. The flexible berm is visually inspected as part of the Facility’s routine inspection program to confirm that it remains in good condition and maintains its design height. Any release from a single container (55 gallons) would be contained within the building. Any additional material would drain towards Sump No. 1.

The totes and drums containing the 3-part binder material are mounted above a containment structure with a capacity of 375 gallons. The system is located under cover, so there is no accumulation of precipitation.

Oily wash water from the pressure wash is stored within the pressure wash room. A leak or spill would flow into the pressure wash sump, which measures 8’ x 8’ x 2’, providing about 957

gallons of containment volume. The tote is filled by a manually-operated sump pump in the room. The tote is translucent, so operators can see the liquid level and prevent overfilling.

A number of other fixed and portable oil storage containers, with capacities from 55 gallons to 500 gallons, are located at the Facility, and are included in Table 2-1. These containers are single walled tanks located in areas that drain to one of the three storm water sumps. These sumps provide sufficient secondary containment for the capacity of the oil storage containers.

5.4 Drainage of Secondary Containment Areas

Drainage of uncontaminated storm water from a secondary containment structure into a storm drain or into an open watercourse, lake or pond is not allowed unless:

- The drain valve is normally closed;
- The retained storm water is inspected to ensure that a sheen or discoloration is not present;
- The drain valve is opened, then closed following draining under responsible supervision or the contents pumped out or removed with a vacuum truck; and
- Adequate records are kept of the drainage events.

The drains for secondary containment dikes are normally locked in the closed position. When accumulated precipitation must be drained from a containment area, the valve is operated under the supervision of the Environmental Department, and is closed after the area has been drained. Records of containment area drainage are maintained by the Environmental Department.

5.5 Discharge Prevention Engineering

The discharge prevention engineering for existing storage containers is discussed in Section 5.3 above. Any new or updated container installations will be constructed in accordance with good engineering practices to avoid discharges.

Where pipes pass through a dike or under a roadway, they are protected by a cement pipe vault and a protective asphalt coating. Pipe supports are designed to minimize abrasion and allow for expansion.

There is no buried piping at ABI. If in the future buried pipelines are installed, the pipe will be wrapped and exposed sections visually observed by operators throughout their respective shifts. If a section of buried line is exposed for any reason, it will be examined for deterioration. Buried piping is integrity and leak tested at the time of installation, modification, construction, relocation, or replacement.

The integrity and leak testing of buried oil piping is discussed in Section 5.7.

5.6 Transfer, Loading and Unloading Activities

Asphalt and diesel, are provided to the Facility by contractors via tank truck. The locations of these loading/unloading activities are noted on Figure 2-3. Each truck should be provided with spill equipment for quick and easy access in the event of a spill incident. ABI has posted

requirements for the loading of fuel at each unloading location. Overfill prevention is managed by measuring the liquid level in the tank prior to beginning transfer operations.

Deliveries to replenish materials on site are made at the request of the Purchasing Department based upon feedback from a daily log of the asphalt storage tank levels. The following is the unloading procedure used for oil deliveries at the Facility.

- The driver checks in with appropriate personnel to access the transfer area and generator enclosure.
- The tank truck operator ensures that the wheels of the delivery truck are chocked, and that drip pans or absorbing pads are placed beneath connections that might be prone to leakage.
- Traffic cones or other warnings are provided to be sure that no vehicles endanger transfer operations.
- No smoking is allowed while unloading diesel fuel.
- No transfer takes place before the level in the tank is checked, and it is verified that the tank has sufficient volume available to receive the volume of fuel to be transferred.
- The delivery truck driver supervises each delivery. Throughout the delivery process, each person must be alert, be able to easily view both the delivery truck and the storage tank and be within 25 feet of each. All potential ignition sources in the fuel delivery and surrounding areas (within 50 feet) are disabled or extinguished.
- Once filled, the operator drains the loading/unloading lines to the storage tank and closes drain valves before disconnecting these lines. Lines are not to be disconnected from the truck; a hose reel system is to be used for delivery.
- ABI Facilities Department personnel secure the fill line, lock the entrance to the enclosure (if applicable), and complete the transfer paperwork.
- Prior to departure of the delivery truck, the tank truck driver is to examine the lower most drain and all outlets for leakage, and if necessary, tighten, adjust or replace points of connection to prevent any liquid leakage from the delivery truck while in transit.

During normal operations, this Facility receives gasoline and oils in 55-gallon drums only. Oils are not normally loaded to tank trucks.

In the event oil is received or loaded via tank trucks, the delivery driver and a trained Facility team member and/or contractor will be continuously present during container/tank refilling operations. Wheel chocks, or the equivalent, will be used as a physical barrier system to prevent vehicle movement during oil transfer operations.

Accidental releases of oil during unloading operations will drain, via sheet flow and the Facility's drainage system, to either Sump No. 1 or Sump No. 3. These collection sumps will

provide adequate capacity for the most probable release from this type of activity, which would be less than 55 gallons (see Table 2-3).

5.7 Inspections, Testing and Maintenance

The hot asphalt tank secondary containment area and the storm water sumps are inspected by operating personnel at least weekly for signs of deterioration, leaks, or accumulation of oil inside the secondary containment area and storm water sumps. A copy of the form used to document these inspections is provided in Appendix C. The inspection includes an assessment of the condition of the storage containers and surrounding areas, including secondary containment, to determine the presence or quantity of oil, and the integrity of the containment structure. Inspections of the oil storage locations will identify leaks or spills, deterioration of equipment, damage to equipment, or improper operation. Any irregularities observed are noted on the inspection form and a corrective action/work order is generated. Visible discharges which result in a loss of oil from any container are promptly corrected.

The completed inspection forms are maintained by the Environmental Department for a minimum of three years.

In addition to the weekly inspections, all bulk storage containers (as listed in Table 2-1) at the Facility are tested or inspected for integrity on a regular schedule, and whenever material repairs are made. ABI utilizes the industry standard *SP001: Standard for the Inspection of Aboveground Storage Tanks* published by the Steel Tank Institute (STI). This standard prescribes varying types and schedules of inspections and testing, depending on the size and configuration of the container.

All of the bulk storage containers (drums, bulk storage tanks) at the Facility are shop-fabricated, are smaller than 50,000 gallons, and are equipped with adequate secondary containment. All bulk storage containers are positioned such that a leak would be detected quickly. Therefore, containers at the Facility are evaluated in accordance with the Category 1 standards of SP001.

Accordingly, the containers at the Facility will be evaluated as follows:

- Containers 5,000 gallons and smaller: Annual and Monthly visual inspection by ABI inspector in accordance with SP001 standards.
- Containers over 5,000 gallons: Annual and Monthly visual inspection by ABI inspector in accordance with SP001 standards, and formal external inspection at least once every 20 years by a STI-certified inspector. The Facility may alternately have the inspection by the certified inspector conducted in accordance with the American Petroleum Institute's (API) 653 standard.
- Portable containers: Monthly visual inspection by ABI inspector in accordance with SP001 standards, using the SP001 Portable Container checklist.

At the time of certification of this SPCC Plan, the only bulk storage containers at the Facility with a capacity of greater than 5,000 gallons are the two 10,000-gallon hot asphalt storage tanks. These two tanks are new, having been installed by a qualified contractor in 2010. Accordingly, there is no need to conduct a formal external visual inspection of these new tanks, and the

inspection is deferred at this time. In the future, ABI may elect to have this inspection conducted, and in any case a formal visual inspection will be required no later than 2030.

Facility inspectors conducting the monthly and annual visual inspection must be familiar with the Facility's operations and the integrity inspection program. The inspectors must also have completed training in the Facility's SPCC Plan as described in Sections 5.9 and 5.10. Inspectors conducting the formal external inspection of containers greater than 5,000 gallons must be STI-certified inspectors (or API-certified inspectors if the API standard is used) with experience in tank integrity inspections.

There are no field-constructed storage tanks at the ABI Facility. Therefore, the need to inspect tanks for the risk of brittle fracture or other catastrophe does not apply.

5.8 Security

The emergency power diesel generator enclosure is normally locked. In addition, the entire Facility is restricted by locked gate access and is sufficiently secure to prevent unauthorized access. Only authorized and escorted individuals may be on site.

The plant is typically operated four days per week with routine maintenance conducted in the evenings and on the fifth day. A 24-hour security guard is on the premises during non-operational hours, weekends, and holidays.

All oil containing loading/unloading connections are securely capped or blank-flanged when not in service or standby service. All pumps are located within the security system of the Facility and are accessible only to authorized personnel and visually monitored/inspected by operating personnel.

All controls for operation are located in locked control cabinets or a manned control room. Facility lighting is adequate for discovery of spills occurring during hours of darkness, for the prevention of spills occurring through acts of vandalism, and for the prevention of entry by unauthorized persons.

5.9 Team Member Training

Oil handling personnel are provided with instructions on the operation of the equipment to prevent discharges, discharge processes, applicable pollution control laws, general Facility operations and the contents of the Facility SPCC Plan. A training log is maintained by the Spill Prevention Coordinator recording the personnel trained, the type of training received, and the date of the training. Individual training logs are maintained on file for a minimum of three years at the Facility.

Truck drivers delivering petroleum products to the Facility are assisted by Operators who are instructed in the proper unloading and emergency procedures.

5.10 Annual Briefings

Oil handling personnel are trained at least annually in the operation and maintenance of equipment to prevent discharges of oil. In addition, informal briefings are held periodically

throughout the year to update employees on changes in the regulations, laws, or in-house procedures. New hires that work in areas covered by the Plan are provided SPCC training during new employee orientation.

Training records are maintained on file for a minimum 3 years. Training components will include:

- Applicable pollution control laws, rules, and regulations;
- Any discharges, per Section 112.1(b), since last meeting;
- Any known system failures;
- Any equipment malfunctions;
- Any recently developed precautionary measures;
- Familiarization with the Spill Prevention, Control, and Countermeasure Plan;
- Emergency response procedures;
- Emergency equipment use and maintenance;
- System operation; and
- Safety Data Sheets (SDS) for the products stored onsite.

SECTION 6
SPILL COUNTERMEASURES

Countermeasures are the activities to be performed in the event of a spill. The Facility has incorporated into this SPCC Plan emergency procedure for containment of small releases, internal and external notifications, reporting, and spill cleanup activities.

6.1 Personnel

The primary and alternate Emergency Response Coordinators designated for the site are listed in Section 2.1 and in Table 6-1 of this section. The Emergency Response Coordinator will coordinate spill response activities and has the authority to mobilize the appropriate personnel and equipment in the event of a spill.

Upon discovery of a spill, team members are to immediately notify the primary or alternate Emergency Response Coordinator. The Emergency Response Coordinator will assess the situation and implement the appropriate response procedures. In addition, ABI has trained spill response personnel that may be mobilized. All personnel that handle oil are trained in procedures for containing and handling small spills.

6.2 Emergency Equipment

The Facility will ensure that spill kits are located in the general area of all oil storage and transfer operations and that such kits can be readily retrieved if required.

The personnel involved in handling petroleum products use cell phones and/or two-way radios as internal alarms or emergency communication devices. This communication system is also capable of summoning external assistance.

6.3 Evacuation Plans

ABI Foundry is manned 24 hours per day, 7 days per week. An Emergency Evacuation Plan is maintained by the ABI Safety Department. Evacuation route maps are posted around the Facility in the unlikely event that a potential hazard will require plant-wide evacuation of personnel. Evacuation drills are conducted annually.

6.4 Response Procedures

6.4.1 Internal Notification

The team member discovering a release will immediately notify the primary or alternate Emergency Response Coordinator. The Emergency Response Coordinators can be reached by telephone at the appropriate location or by the mobile phone. The Emergency Response Coordinators can be contacted at their respective office locations or mobile telephone numbers (as provided in Table 6-1) in the event of a spill.

6.4.2 Assessment of Situation

The first priority in a spill is the safety of the workers and the surrounding community, followed by fire and explosion prevention. After these concerns are addressed, protection of the environment will be addressed. The Emergency Response Coordinator will first determine if the site is capable of controlling the release, and if Facility evacuation is required. ABI Foundry has trained emergency response personnel who will serve as the first responders to an emergency situation. The Emergency Response Coordinator will evaluate factors such as type, quantity, and location of material released in order to make a decision.

The site may be evacuated due to a release when deemed necessary by the Emergency Response Coordinator. The supervisors will alert the team members who will immediately follow emergency procedures, which may include shutting off any equipment or sources of ignition and then proceeding to an exit in an orderly fashion. Team members will meet at the location designated in site's written Emergency Plan. The Emergency Response Coordinator, or alternate, will be responsible for accounting for team members, contractors, and guests, as per the site's written Emergency Plan.

6.4.3 Spill Control

The emergency response team will attempt to control the release if the Emergency Response Coordinator has determined that the release poses minimal danger and evacuation of the site is not necessary. Team members should immediately follow emergency procedures and shut-off any equipment or sources of ignition prior to controlling the spill. Response procedures will be limited to controlling the spill by applying absorbent materials to the spill material or creating a dike (e.g., oil dry, sand, socks, pads, etc.).

6.4.4 External Notification

The Emergency Response Coordinator will notify the appropriate local emergency response agencies as needed. In addition, an outside contractor for environmental response will be contacted to respond to spills that cannot be handled by the Facility and the local utility provider will be contacted for leaks associated with onsite transformers. Emergency personnel will be responsible for items such as traffic control, community evacuation, fire control, and medical treatment.

The Emergency Response Coordinator will determine if the release is reportable to regulatory agencies. A reportable oil spill is a release of oil to land of 1 barrel (42 gallons) or more or any release of oil to water that causes a film, sheen, discoloration, or emulsion on or below the surface of the water or adjoining shorelines.

In the event of a contained reportable release to land, the Emergency Response Coordinator will notify the local CUPA (ACDEH) as soon as possible (see Table 6-1). The Emergency Response Coordinator must also notify the U.S. EPA in the event of a reportable release. The Emergency Response Coordinator will notify government agencies by telephone or Fax **immediately** or **no later than one hour** after discovery of a reportable spill. Also, written Follow-Up Reports (Section 304) are required within 7 days if the release equals or exceeds the Federal Reportable Quantities (40 CFR §302.4).

The Emergency Response Coordinator will be prepared to present the following verbal information:

- The address, source, and location of the discharge;
- The date and time of the spill;
- Material released;
- An estimated quantity of material released and duration of the event;
- The source of the spill and media affected;
- The extent of water pollution and names of the waters involved;
- The names, address, and telephone number of the Emergency Response Coordinator; and
- The steps being taken to minimize impact or contain the spill.

A follow-up written report will be submitted within seven (7) days to the local CUPA office (ACDEH, CUPA/Hazardous Materials Division) and U.S. EPA Regional Administrator if an oil spill exceeds 1,000 gallons or if two discharges greater than 42-gallons occur in any 12-month period. The written report will contain:

- Name and location of the site;
- Name of owner/operator;
- Date and year of initial operation;
- Maximum storage or handling capacity of oil at the site;
- Facility description with maps and flow diagrams;
- SPCC Plan and failure analysis;
- Cause of spill and failure analysis;
- Corrective actions taken; and
- Additional preventive measures taken to minimize the possibility of recurrence.

A summary of emergency contact numbers and reporting numbers for the agencies discussed above are provided in Table 6-1.

6.4.5 Clean-up and Disposal

Spill residues and other contaminated materials will be characterized using the appropriate SDS, available information or laboratory analyses and disposed in accordance with applicable regulations. Spill response supplies or equipment depleted or destroyed, as a result of response activities, will be replaced as soon as practical. Additional clean-up activities may be required if impacts to soil and/or groundwater have occurred. The Facility used oil disposal contractor can provide vacuum tanker truck services for disposal of large oil spills contained in the collection sumps.

6.4.6 Documentation

The Emergency Response Coordinator will complete the Spill Report Form contained in Appendix B during the incident or immediately following. The Emergency Response Coordinator will keep a log of activities during the spill event including the nature and extent of the spill, the response actions taken, outside assistance required, the quantity and disposition of spill materials, an assessment of environmental damage, and contact with emergency or regulatory agencies. The Emergency Response Coordinator will also maintain a record of the progress of activities and itemized expenditures during the cleanup.

Table 6-1
Emergency and Reporting Contact List

Emergency Response Coordinators			
Rank	Name	Work Phone	Mobile Phone
Primary	Melisa Cohen – Env. Mgr.	510-633-5224	510-332-3569
Alternate	Rich Watson – Plant Mgr.	510-632-3467	510-502-4896

Spill Reporting Contacts		
Agency	**Telephone Number**	**Reporting Trigger**
National Response Center	800-424-8802	Reportable spill
California Emergency Management Agency	800-852-7550	Reportable spill
US EPA Region 9 Oil Spill Hotline	800-300-2193	Reportable spill
California Certified Unified Program Agency	510-567-6700	Reportable spill
California Department of Toxic Substances Control	800-260-3972	Reportable spill

Fire/Police/Ambulance	911	Injury/Fire

SECTION 7
FACILITY RESPONSE PLAN

All facilities regulated under 40 CFR Part 112 must conduct an initial screening to determine whether they "could cause substantial harm to the environment by discharging oil" and, consequently, be required to develop a Facility Response Plan (FRP) under §112.20.

FRPs are not required for any of the facilities included in this SPCC Plan because none of the criteria outlined in the "Certification of Substantial Harm Determination Form" have been met or occurred. The completed form is included in Appendix D

APPENDIX A
SPCC TASK SUMMARY

Task	Task Details	Requirement Source (40 CFR)	Form Type	Location in SPCC Plan
Weekly Requirements				
Inspect oil storage containers/tanks, oil storing/containing equipment once per week.	Perform weekly inspections and maintain inspection records. Maintain inspection records for a minimum of 3 years.	§112.8(c)(6) or §112.12(c)(6)	Weekly Inspection Form	Appendix C
Monthly Requirement				
Inspect storage tanks per SP001	Conduct inspection of all fixed bulk storage containers listed on Table 2-1 using the *SP001 Monthly Inspection Checklist*.	§112.8(c)(6) or §112.12(c)(6)	SP001 Monthly Inspection Checklist	Maintain in Files with SPCC Plan
Inspect portable storage containers per SP001	Conduct inspection of all portable storage containers (drums/totes) listed on Table 2-1 using the *SP001 Portable Container Monthly Inspection Checklist*	§112.8(c)(6) or §112.12(c)(6)	SP001 Portable Container Monthly Inspection Checklist	Maintain in Files with SPCC Plan
Annual Requirement				
Inspect storage tanks per SP001	Conduct inspection of all fixed bulk storage containers listed on Table 2-1 using the *SP001 Annual Inspection Checklist*.	§112.8(c)(6) or §112.12(c)(6)	SP001 Annual Inspection Checklist	Maintain in Files with SPCC Plan
Team Member Training	Train oil handling personnel to prevent discharges; discharge procedure protocols; applicable pollution control laws, rules, and regulations; general facility operations; and, the contents of the facility SPCC Plan.	§112.7(f)	Training Records	On-site Files

Task	Task Details	Requirement Source (40 CFR)	Form Type	Location in SPCC Plan
Every 5 Year Requirement (conducted annually by ABI)				
Complete review and evaluation of the SPCC Plan.	As a result of this review and evaluation, amend SPCC Plan within six months of the review to include more effective prevention and control technology if the technology has been field-proven at the time of the review and will significantly reduce the likelihood of a discharge from the Facility. Certify the technical amendment with a Registered P.E. Certification if the original SPCC Plan was certified by a Registered P.E.	§112.5(b) & (c)	----	----
Every 20 Year Requirement (Due by 2030 or sooner if deemed appropriate)				
Formal SP001 External Inspection of Shop-Built Aboveground Tanks	Obtain a formal inspection of bulk storage containers larger than 5,000 gallons by STI-certified inspector.	§112.8(c)(6) or §112.12(c)(6)	Provided by Inspector	Maintain in Files with SPCC Plan

Task	Task Details	Requirement Source (40 CFR)	Form Type	Location in SPCC Plan
Contingent Requirements				
Amend SPCC Plan upon any a change in the facility design, construction, operation, or maintenance that materially affects its potential for an oil discharge.	Record the changes in the SPCC Plan Example, commissioning or decommissioning containers; replacement, reconstruction, or movement of containers. Any required amendment must be incorporated into this SPCC Plan within six months, and implemented as soon as possible, but not later than six months following preparation of the amendment.	§112.5(a)	----	----
In the event that the Facility experiences a discharge of 1,000 gallons of oil in a single discharge, or discharges 42 gallons of oil in each of two discharges during any twelve month period.	Submit information in Section 6.4.4 to the U.S. EPA Regional Administrator (Region 9). Subsequently, the SPCC Plan may be required to be amended within 30-days of notice from the U.S. EPA Regional Administrator. The amended SPCC Plan must be implemented as soon as possible, but not later than within six months of the amendment.	§112.1(b)	Spill Reporting Form	Appendix B

If any of these questions were marked with *, please provide comment:

At all current bulk tank locations, there are no containment liners or expansion joint seam sealers.

_____

At all current bulk tank locations, underground piping is not present; therefore, leak detection for underground piping is not present.

_____

None of the current bulk tanks operate with a “test button” and requires no battery charging.

_____

	AB&I Foundry Environmental Work Instruction ABI-EWI-010-01-F02 SPCC Plan Annual Review Form	Issue Date: 08/22/08 Revision Date: Page 1 of 1

1. Is the facility contact and emergency information up to date? ☐Yes ☐No
   - If No, when will this be correct?

2. Has the management approval been signed by the responsible individual? ☐Yes ☐No
   - If No, when will this be correct?

3. Does the plan contain the Professional Engineers Certification? ☐Yes ☐No
   - If No, when will this be correct?

4. Has the person designated as accountable for discharge prevention at the facility changed? ☐Yes ☐No
   - If Yes, has this change been reflected in the plan? When?

5. Has there been a change at the facility that materially affects the potential for a discharge? ☐Yes ☐No
   - If Yes, when will this be corrected?

6. Has the facility discharged a reportable quantity of oil in amounts considered harmful:
   - more than 1,000 gallons of oil in a single discharge ☐Yes ☐No
   - or more than 42 gallons in each of two discharges in any 12-month period? ☐Yes ☐No

   - If Yes, was information submitted as required in §112.4(a)? ☐Yes ☐No
   - Were they reported to the NRC? ☐Yes ☐No
   - Have requested changes to the plan and/or the facility been made and implemented? ☐Yes ☐No

7. Does the plan include a diagram with location and contents of all regulated containers, transfer stations, and connecting pipes? ☐Yes ☐No
   - If No, when will this be corrected?

8. Does the plan include a prediction of the direction, rate of flow, and total quantity of oil that could be discharged for each type of major equipment failure? ☐Yes ☐No
   - If No, when will this be corrected?

9. Have there been any changes at the facility that would require updating the PE Certification? ☐Yes ☐No
   - If Yes, when will this be corrected?

10. Have you conducted the discharge prevention briefings for oil handling personnel? ☐Yes ☐No
    - If No, when will this be corrected?

11. Have all changes been implemented within 6 months of the change? ☐Yes ☐No
    - If No, when will this be corrected?

APPENDIX D
CERTIFICATION OF SUBSTANTIAL HARM DETERMINATION FORM

CERTIFICATION OF THE APPLICABILITY OF
THE SUBSTANTIAL HARM CRITERIA

Facility Name: ABI Foundry
Facility Address: 7825 San Leandro Street
Oakland, California 94621

Does the Facility have a maximum storage capacity greater than or equal to 42,000 gallons and do the operations include over water transfers of oil to or from vessels?

Yes _____ No X

Does the Facility have a maximum storage capacity greater than or equal to 1 million (1,000,000) gallons and is the Facility without secondary containment for each aboveground storage area sufficiently large to contain the capacity of the largest aboveground storage tank within the storage area?

Yes _____ No X

Does the Facility have a maximum storage capacity greater than or equal to 1 million (1,000,000) gallons and is the Facility located at a distance such that a discharge from the Facility could cause injury to an environmentally sensitive area?

Yes _____ No X

Does the Facility have a maximum storage capacity greater than or equal to 1 million (1,000,000) gallons and is the Facility located at a distance such that a discharge from the Facility would shut down a public drinking water intake?

Yes _____ No X

Does the Facility have a maximum storage capacity greater than or equal to 1 million (1,000,000) gallons, and within the past five years, has the Facility experienced a reportable spill in an amount greater than or equal to 10,000 gallons?

Yes _____ No X

CERTIFICATION

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe that the submitted information is true, accurate, and complete.

Hazardous Materials

Does your facility have on site (for any purpose) at any one time, hazardous materials at or above 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet for compressed gases (include liquids in ASTs and USTs); or is regulated under more restrictive inventory local reporting requirements (shown below if present); or the applicable Federal threshold quantity for an extremely hazardous substance specified in 40 CFR Part 355, Appendix A or B; or handle radiological materials in quantities for which an emergency plan is required pursuant to 10 CFR Parts 30, 40 or 70?	**Yes**

Underground Storage Tank(s) (UST)

Does your facility own or operate underground storage tanks?	**No**

Hazardous Waste

Is your facility a Hazardous Waste Generator?	**Yes**
Does your facility treat hazardous waste on-site?	**No**
Is your facility's treatment subject to financial assurance requirements (for Permit by Rule and Conditional Authorization)?	**No**
Does your facility consolidate hazardous waste generated at a remote site?	**No**
Does your facility need to report the closure/removal of a tank that was classified as hazardous waste and cleaned on-site?	**No**
Does your facility generate in any single calendar month 1,000 kilograms (kg) (2,200 pounds) or more of federal RCRA hazardous waste, or generate in any single calendar month greater than 1 kg (2.2 pounds) of RCRA acute hazardous waste; or generate more than 100 kg (220 pounds) of spill cleanup materials contaminated with RCRA acute hazardous waste.	**Yes**
Is your facility a Household Hazardous Waste (HHW) Collection site?	**No**

Excluded and/or Exempted Materials

Does your facility recycle more than 100 kg/month of excluded or exempted recyclable materials (per HSC 25143.2)?	**Yes**
Does your facility own or operate ASTs above these thresholds? Store greater than 1,320 gallons of petroleum products (new or used) in aboveground tanks or containers.	**Yes**
Does your facility have Regulated Substances stored onsite in quantities greater than the threshold quantities established by the California Accidental Release prevention Program (CalARP)?	**No**

Additional Information

No additional comments provided.

CALIFORNIA ENVIRONMENTAL REPORTING SYSTEM (CERS)

CONSOLIDATED EMERGENCY RESPONSE / CONTINGENCY PLAN

Prior to completing this Plan, please refer to the INSTRUCTIONS FOR COMPLETING A CONSOLIDATED CONTINGENCY PLAN

FACILITY ID # A1.	CERS ID # A2. 10238632	DATE OF PLAN PREPARATION/REVISION (MM/DD/YYYY) A3. 02/26/2020

BUSINESS NAME *(Same as Facility Name or DBA - Doing Business As)* A4.
AB&I Foundry

BUSINESS SITE ADDRESS A5.
7825 San Leandro Street

BUSINESS SITE CITY A6.		ZIP CODE A7.
Oakland	CA	94621

TYPE OF BUSINESS (e.g., Painting Contractor) A8.	INCIDENTAL OPERATIONS (e.g., Fleet Maintenance) A9.
Iron Foundry	Iron Melting and Pouring

THIS PLAN COVERS CHEMICAL SPILLS, FIRES, AND EARTHQUAKES INVOLVING (Check all that apply): A10.

☒ 1. HAZARDOUS MATERIALS; ☒ 2. HAZARDOUS WASTES

INTERNAL FACILITY EMERGENCY RESPONSE WILL OCCUR BY (Check all that apply): B1.

☒ 1. CALLING PUBLIC EMERGENCY RESPONDERS (e.g., 9-1-1)
☒ 2. CALLING HAZARDOUS WASTE CONTRACTOR
☒ 3. ACTIVATING IN-HOUSE EMERGENCY RESPONSE TEAM

In the event of an emergency involving hazardous materials and/or hazardous waste, all facilities must IMMEDIATELY:

1. Notify facility personnel and evacuate if necessary in accordance with the Emergency Action Plan (Title 8 California Code of Regulations §3220);
2. Notify local emergency responders by calling 9-1-1;
3. Notify the local Unified Program Agency (UPA) at the phone number below; and
4. Notify the State Warning Center at (800) 852-7550.

Facilities that generate, treat, store or dispose of hazardous waste have additional responsibilities to notify and coordinate with other response agencies. Whenever there is an imminent or actual emergency situation such as an explosion, fire, or release, the Emergency Coordinator must follow the appropriate requirements for the category of facility and type of release involved:

1. Title 22 California Code of Regulations §66265.56. Emergency Procedures for generators of 1,000 kilograms or more of hazardous waste in any calendar month.
2. Title 22 California Code of Regulations §66265.196. Response to Leaks or Spills and Disposition of Leaking or Unfit-for-Use Tank Systems.
3. Title 40 Code of Federal Regulations §302.6. Notification requirements for a release of a hazardous substance equal to or greater than the reportable quantity.
4. Title 22 California Code of Regulations §66262.34(d)(2) and Title 40 Code of Federal Regulations §262.34(d)(5)(ii) for generators of less than 1000 kilograms of hazardous waste in any calendar month.

Following notification and before facility operations are resumed in areas of the facility affected by the incident, the Emergency Coordinator shall notify the local UPA and the local fire department's hazardous materials program, if necessary, that the facility is in compliance with requirements to:

1. Provide for proper storage and disposal of recovered waste, contaminated soil or surface water, or any other material that results from an explosion, fire, or release at the facility; and
2. Ensure that no material that is incompatible with the released material is transferred, stored, or disposed of in areas of the facility affected by the incident until cleanup procedures are completed.

EMERGENCY RESPONSE PHONE NUMBERS:

	OTHER (Specify):	C7.	C8.
	OTHER (Specify):	C9.	C10.

INTERNAL FACILITY EMERGENCY COMMUNICATIONS OR ALARM NOTIFICATION WILL OCCUR BY (Check all that apply): C11.

- [x] 1. VERBAL WARNINGS;
- [ ] 2. PUBLIC ADDRESS OR INTERCOM SYSTEM;
- [x] 3. TELEPHONE;
- [ ] 4. PAGERS;
- [x] 5. ALARM SYSTEM;
- [x] 6. PORTABLE RADIO

NOTIFICATIONS TO NEIGHBORING FACILITIES THAT MAY BE AFFECTED BY AN OFF-SITE RELEASE WILL OCCUR BY (Check all that apply): C12.

- [x] 1. VERBAL WARNINGS;
- [ ] 2. PUBLIC ADDRESS OR INTERCOM SYSTEM;
- [x] 3. TELEPHONE;
- [ ] 4. PAGERS;
- [ ] 5. ALARM SYSTEM;
- [ ] 6. PORTABLE RADIO

EMERGENCY COORDINATOR CONTACT INFORMATION: C13.

PRIMARY EMERGENCY COORDINATOR NAME: Richard Watson PHONE NO.: (510) 633-5247 PHONE NO.: (510) 502-4896

ALTERNATE EMERGENCY COORDINATOR NAME: Dale Darling PHONE NO.: (510) 633-5286 PHONE NO.: (510) 206-6048

- [x] Check if additional Emergency Coordinator contact and address information is available onsite or by calling PHONE NO.: (510) 632-3467

Note: If more than one alternate emergency coordinator is designated, attach a list in order of responsibility.

D. EMERGENCY CONTAINMENT AND CLEANUP PROCEDURES

Check the applicable boxes to indicate your facility's procedures for containing spills and preventing and mitigating releases, fires and/or explosions.

D1.

- [x] 1. MONITOR FOR LEAKS, RUPTURES, PRESSURE BUILD-UP, ETC.;
- [x] 2. PROVIDE STRUCTURAL PHYSICAL BARRIERS (e.g., Portable spill containment walls, built-in berms);
- [x] 3. PROVIDE ABSORBENT PHYSICAL BARRIERS (e.g., Pads, spill pigs, spill pillows);
- [x] 4. COVER OR BLOCK FLOOR AND/OR STORM DRAINS;
- [x] 5. LINED TRENCH DRAINS AND/OR SUMPS;
- [x] 6. AUTOMATIC FIRE SUPPRESSION SYSTEM;
- [x] 7. ELIMINATE SOURCES OF IGNITION FOR FLAMMABLE HAZARDS;
- [x] 8. STOP PROCESSES AND/OR OPERATIONS;
- [x] 9. AUTOMATIC / ELECTRONIC EQUIPMENT SHUT-OFF SYSTEM;
- [x] 10. SHUT OFF WATER, GAS, ELECTRICAL UTILITIES;
- [x] 11. CALL 9-1-1 FOR PUBLIC EMERGENCY RESPONDER ASSISTANCE AND/OR MEDICAL AID;
- [x] 12. NOTIFY AND EVACUATE PERSONS IN ALL THREATENED AND/OR IMPACTED AREAS;
- [x] 13. ACCOUNT FOR EVACUATED PERSONS IMMEDIATELY AFTER EVACUATION;
- [ ] 14. PROVIDE PROTECTIVE EQUIPMENT FOR ON-SITE EMERGENCY RESPONSE TEAM;
- [x] 15. REMOVE CONTAINERS AND/OR ISOLATE AREAS;
- [x] 16. HIRE LICENSED HAZARDOUS WASTE CONTRACTOR;
- [x] 17. USE ABSORBENT MATERIAL FOR SPILL CONTAINMENT;
- [x] 18. VACUUM SUCTION USING APPROPRIATE VACUUM (e.g., Intrinsically safe) FOR SPILL CONTROL AND/OR CLEANUP;
- [x] 19. DECONTAMINATE PERSONNEL AND EQUIPMENT WITHIN DESIGNATED AREA AND DISPOSE OF WASTEWATER AS HAZARDOUS WASTE;
- [x] 20. PROVIDE SAFE TEMPORARY STORAGE OF HAZARDOUS WASTE GENERATED DURING EMERGENCY ACTIONS;
- [ ] 21. OTHER (Specify): D2.

E. FACILITY EVACUATION

THE FOLLOWING ALARM SIGNAL(S) WILL BE USED TO BEGIN EVACUATION OF THE FACILITY (Check all that apply): E1.

E2.

- [ ] 1. BELLS;
- [x] 2. HORNS/SIRENS;
- [x] 3. VERBAL (i.e., Shouting);
- [x] 4. OTHER (Specify): Portable Radios

THE FOLLOWING LOCATION(S) WILL BE USED FOR AN EMERGENCY ASSEMBLY AREA(S) (e.g., Parking lot, street corner): E3.

77th Avenue - Near Gate 3

Note: The Emergency Coordinator must account for all onsite employees and visitors after evacuation.

EVACUATION ROUTE S AND ALTERNATE EVACUATION ROUTES ARE DESCRIBED AS FOLLOWS: E4.

- [x] 1. WRITTEN PROCEDURES DESCRIBING ROUTES, EXITS, AND ASSEMBLY AREAS;
- [x] 2. EVACUATION MAP(S) DEPICTING ROUTES, EXITS, AND ASSEMBLY AREAS;
- [ ] 3. OTHER (Specify): E5.

Note: Evacuation procedures and/or maps should be posted in visible facility locations and must be included in the Contingency Plan.

F. ARRANGEMENTS FOR EMERGENCY SERVICES

ADVANCE ARRANGEMENTS FOR LOCAL EMERGENCY SERVICES (Check one of the following): F1.

- [ ] 1. HAVE BEEN DETERMINED NOT NECESSARY;
- [x] 2. THE FOLLOWING ARRANGEMENTS HAVE BEEN MADE (Specify): Oakland Fire Dept on-call during permit-required confined space work F2.

Note: Advance arrangements with local fire and police departments, hospitals, state and local emergency response teams, and/or emergency services contractors should be made for your facility, if necessary. Large Quantity Generators must describe arrangements in the Contingency Plan.

G. EMERGENCY EQUIPMENT

Check the applicable boxes to list emergency response equipment available at the facility, identify the location(s) where the equipment is kept, and indicate the equipment's capability, if applicable.

TYPE	EQUIPMENT AVAILABLE G1.	LOCATION G2.	CAPABILITY G3.
EXAMPLE	☒ *CHEMICAL PROTECTIVE GLOVES*	*SPILL RESPONSE KIT*	*SINGLE USE, OIL RESISTANT ONLY*
Safety and First Aid	1. ☐ CHEMICAL PROTECTIVE SUITS, APRONS, AND/OR VESTS	Stockroom	
	2. ☐ CHEMICAL PROTECTIVE GLOVES	Stockroom	
	3. ☐ CHEMICAL PROTECTIVE BOOTS	Stockroom	
	4. ☐ SAFETY GLASSES, GOGGLES, AND FACE SHIELDS	Stockroom	
	5. ☐ HARD HATS	Stockroom	
	6. ☐ AIR-PURIFYING RESPIRATORS	Stockroom	
	7. ☐ SELF-CONTAINED BREATHING APPARATUS (SCBA)		
	8. ☐ FIRST AID KITS	Several Locations - See Site Map	
	9. ☐ PLUMBED EYEWASH FOUNTAIN AND/OR SHOWER	Plantwide	
	10. ☐ PORTABLE EYEWASH KITS AND/OR STATION		
	11. ☐ OTHER		
Fire Fighting	12. ☐ PORTABLE FIRE EXTINGUISHERS	Several Locations - See Site Map	
	13. ☐ FIXED FIRE SUPPRESSION SYSTEMS AND/ OR SPRINKLERS	Main Office	
	14. ☐ FIRE ALARM BOXES		
	15. ☐ OTHER		
Spill Control and Clean-Up	16. ☐ ALL-IN-ONE SPILL KIT	Several Locations - See Site Map	
	17. ☐ ABSORBENT MATERIAL	Stockroom	
	18. ☐ CONTAINER FOR USED ABSORBENT	Stockroom	
	19. ☐ BERM AND/OR DIKING EQUIPMENT	Stockroom	
	20. ■ BROOM	Stockroom	
	21. ■ SHOVEL	Stockroom	
	22. ☐ VACUUM		
	23. ☐ EXHAUST HOOD		
	24. ☐ SUMP AND/OR HOLDING TANK		
	25. ☐ CHEMICAL NEUTRALIZERS		
	26. ☐ GAS CYLINDER LEAK REPAIR KIT		
	27. ☐ SPILL OVERPACK DRUMS		
	28. ☐ OTHER		
Communi-cations and Alarm Systems	29. ☐ TELEPHONES (e.g., Cellular)	Plantwide	
	30. ☐ INTERCOM AND/OR PA SYSTEM	Plantwide	
	31. ☐ PORTABLE RADIOS	Plantwide	
	32. ☐ AUTOMATIC ALARM CHEMICAL MONITORING EQUIPMENT		
Other	33. ☐ OTHER		
	34. ☐ OTHER		

H. EARTHQUAKE VULNERABILITY

Identify areas of the facility that are vulnerable to hazardous materials releases due to seismic motion. These areas require immediate isolation and inspection.

VULNERABLE AREAS (Check all that apply): H1.

- [x] 1. HAZARDOUS MATERIALS AND/OR WASTE STORAGE AREAS
- [x] 2. PROCESS LINES AND PIPING
- [ ] 3. LABORATORY
- [ ] 4. WASTE TREATMENT AREA

LOCATIONS (e.g., Shop, outdoor shed, lab): H2.

Cupola Baghouse/Oil Room
Liquid Oxygen/Nitrogen Tanks

Identify mechanical systems vulnerable to releases / spills due to earthquake-related motion. These systems require immediate isolation and inspection.

VULNERABLE SYSTEMS AND/OR EQUIPMENT (Check all that apply): H3.

- [x] 1. SHELVES, CABINETS AND/OR RACKS
- [x] 2. TANKS AND SHUT-OFF VALVES
- [x] 3. PORTABLE GAS CYLINDERS
- [x] 4. EMERGENCY SHUT-OFF AND/OR UTILITY VALVES
- [x] 5. SPRINKLER SYSTEMS
- [ ] 6. STATIONARY PRESSURIZED CONTAINERS (e.g., Propane tank)

LOCATIONS: H4.

Plantwide
Plantwide
Plantwide

Main Buildings

I. EMPLOYEE TRAINING

Employee training is required for all employees and/or contractors handling hazardous materials and/or hazardous wastes during normal and/or emergency operations. Most facilities will need to submit a separate Training Plan. However, your CUPA may accept this section as the Training Plan for some small facilities.
Employee training plans may include the following content:

- Applicable laws and regulations;
- Emergency response plans and procedures;
- Safety Data Sheets;
- Hazard communication related to health and safety;
- Methods for safe handling of hazardous substances;
- Hazards of materials and processes (e.g., fire, explosion, asphyxiation);
- Hazard mitigation, prevention and abatement procedures;
- Coordination of emergency response actions;
- Notification procedures for local emergency responders, CUPA, Cal OES, and onsite personnel;
- Communication and alarm systems;
- Personal protective equipment;
- Use and maintenance of emergency response equipment and supplies (e.g. Fire extinguishers, respirators, spill control materials);
- Decontamination procedures;
- Evacuation procedures and evacuation staging locations;
- Identification of facility areas, equipment, and systems vulnerable to earthquakes and other natural disasters.
- OTHER (Specify):

Check the applicable boxes below to indicate how the employee training program is administered.

- [x] 1. FORMAL CLASSROOM
- [x] 2. VIDEOS
- [x] 3. SAFETY MEETINGS
- [ ] 4. STUDY GUIDES / MANUALS I1.
- [ ] 5. OTHER (Specify): I2.
- [ ] 6. NOT APPLICABLE SINCE FACILITY HAS NO EMPLOYEES
- [ ] 7. CHECK IF A SEPARATE EMPLOYEE TRAINING PLAN IS USED AND UPLOADED TO CERS AS A PDF DOCUMENT I3.
- [x] 8. CHECK IF EMPLOYEE TRAINING IS COVERED BY THE ABOVE REFERENCED CONTENT AND OTHER DOCUMENTS ONSITE I4.

EMPLOYEE TRAINING FREQUENCY AND RECORDKEEPING TRAINING MUST BE:

- Provided initially for new employees as soon as possible following the date of hire. New employees should not work in an unsupervised position that involves hazardous materials handling and/or hazardous waste management without proper training;
- Provided within six months from the date of hire for new employees at a large quantity generator;
- Ongoing and provided at least annually;
- Amended prior to a change in process or work assignment;
- Given upon modification to the Emergency Response/Contingency Plan.

Large Quantity Generator Training: Large quantity generators (1,000 kg or more) must retain written plan and documentation of employee training which includes:

- A written description of the type and amount of both initial and ongoing training that will be given to persons filling each job position having responsibility for hazardous waste management and/or emergency response.
- The name, job title and job description for each position at the facility related to hazardous waste management.
- Current employee training records must be retained until closure of the facility and former employee training records must be retained for at least three years after termination of employment.

Small Quantity Generator Training: Small quantity generators (less than 1,000 kg) must include basic hazardous waste management and emergency response procedures but a written employee training plan and training records are not required. In order to show that the facility has met the small quantity generator employee training requirement, an employee training plan and training records may be made available.

Hazardous Materials Business Plan Training: Businesses must provide initial and annual employee training that includes the content referenced above. The training may be based on the job position and training records must be made available for a period of at least three years.

J. LIST OF ATTACHMENTS

Check one of the following: J1.

- [x] 1. NO ATTACHMENTS ARE REQUIRED; or
- [ ] 2. THE FOLLOWING DOCUMENTS ARE ATTACHED: J2.

I. TYPE OF RECYCLING ACTIVITIES

If yes, please follow instructions.

1. Do you recycle more than 100 kg/month of excluded or exempted recyclable material at the same location at which the material was generated (onsite recycling)?	502 ☒ YES ☐ NO	✓ If YES, you are both the generator and recycler. Complete one Recyclable Materials Report. Do not complete Parts II and V.
2. Do you recycle more than 100 kg/month of non-manifested, excluded recyclable materials received from an offisite location (offsite recycling)?	503 ☐ YES ☒ NO	✓ If YES, you are an offsite recycler but not the generator. Complete a Recyclable Materials Report for each generator that sends you materials.

--Businesses that only send recyclable materials to an offsite recyclers are not required to file this report. --

II. OFFSITE GENERATOR OF RECYCLABLE MATERIAL

Only complete when the generator is different from the recycler.

NAME OF SIGNER (print) 517	TITLE OF SIGNER	518
Michael Lowe	General Manager	

Recyclable Materials Biennial Report Page 1

Complete this report if you recycle more than 100 kilograms per month of recyclable material under a claim that the material qualifies for an exclusion or exemption pursuant to HSC §25143.2. Facilities that recycle at the same location at which the material was generated (onsite recyclers) and facilities that recycle materials generated at an offsite location (offsite recyclers) must complete a report. Persons who send materials to another location to be recycled, and who do not recycle material onsite under a claim to an exclusion or exemption provided in HSC § 25143.2, need not complete a report.

Offsite recyclers must complete one report for **each** generator from whom they receive recyclable materials. Complete a **separate** Page 2 of the Report for **each** recyclable material. When this report is submitted, provide a copy of the completed report to the generator of the material recycled.

Refer to HSC §25143.10 for reporting requirements for recyclers.

(Note: the numbering of the instructions follows the data element numbers that are on the UPCF pages. These data element numbers are used for electronic submission and are the same as the numbering used in 27 CCR, Appendix C, the Business Section of the Unified Program Data Dictionary.)

Please number all pages of your submittal. This helps your CUPA or local agency identify whether the submittal is complete and if any pages are separated.

1. **FACILITY ID NUMBER** - Leave this blank. This number is assigned by the CUPA. This is the unique number that identifies your facility.
2. **EPA ID NUMBER** - Enter your facility's 12-character U.S. Environmental Protection Agency (U.S. EPA) or California Identification number. For facilities in California, the number usually starts with the letters "CA". If you do not have a number contact the DTSC Telephone Information Center at (916) 324-1781, (800) - 61-TOXIC or (800) 61-86942, to obtain one.
3. **BUSINESS NAME** - Enter the full legal name of the business.

500. **BEGINNING DATE OF REPORTING PERIOD** - Enter the beginning date of the reporting period for this report. This report is for two calendar years and is due on July 1 of every even-numbered year.
501. **ENDING DATE OF REPORTING PERIOD** - Enter the ending date of the reporting period for this report.
502. **ONSITE RECYCLING** - Check "Yes" if the recycling facility recycles more than 100 kilograms per month of recyclable material generated onsite under a claim that the material qualifies for an exclusion or exemption pursuant to HSC §25143.2. Check "No" if the recycling facility does not recycle onsite.
503. **OFFSITE RECYCLING** - Check "Yes" if the recycling facility recycles more than 100 kilograms per month of recyclable material under a claim that the material qualifies for an exclusion, or exemption pursuant to HSC §25143.2, and that material was received from one or more offsite locations. Check "No" if the recycling facility does not recycle material generated offsite.
504. **OFFSITE GENERATOR NAME** - If the generator is different from the recycler, enter the name of the person that generated the recyclable material. Complete a separate report for each generator.
505. **OFFSITE GENERATOR EPA ID NUMBER** - Enter the generator's 12-character U.S. Environmental Protection Agency (EPA) identification number. If the generator needs but does not yet have an identification number, the owner or operator can contact the Telephone Information Center at (916) 324-1781.

506. **OFFSITE GENERATOR STREET ADDRESS** 507. **OFFSITE GENERATOR PHONE NUMBER** 508. **OFFSITE GENERATOR CITY** 509. **OFFSITE GENERATOR STATE** 510. **OFFSITE GENERATOR ZIP CODE**	Complete items **506 – 510** for each generator of recyclable material.

511. **OFFSITE GENERATOR MAILING ADDRESS** 512. **CITY FOR MAILING ADDRESS** 513. **STATE FOR MAILING ADDRESS** 514. **ZIP CODE FOR MAILING ADDRESS**	Complete items **511 – 514** if the mailing address for the offsite generator is different from the street address.

SIGNATURE OF CERTIFIER - The business owner/operator of the recycling facility shall sign in the space provided. This signature certifies that the signer believes that the information submitted is true, accurate, and complete.

515. **DATE CERTIFIED** - Enter the date that the certification was signed.
516. **NAME OF DOCUMENT PREPARER** - Enter the name of the person who prepared the report.
517. **CERTIFIER NAME** - Enter the full printed name of the certifier.
518. **CERTIFIER TITLE** - Enter the title of the person signing the report.

V. DOCUMENTATION OF KNOWN MARKET (Offsite recyclers only)

☐ DOCUMENTATION IS ATTACHED: Offsite recyclers must attach documentation that there was a known market for disposition of the recyclable material and any products manufactured from the recyclable materials and provide copy of this report to the generator when the report is submitted to the CUPA. (HSC Section 25143.10(a)(3)(A)) 552

Recyclable Materials Biennial Report Page 2

Complete a **separate** Page 2 of the Report for each recyclable material.

(Note: the numbering of the instructions follows the data element numbers that are on the UPCF pages. These data element numbers are used for electronic submission and are the same as the numbering used in 27 CCR, Appendix C, the Business Section of the Unified Program Data Dictionary.)

Please number all pages of your submittal. This helps your CUPA or AA identify whether the submittal is complete and if any pages are separated.

519. TOTAL NUMBER OF RECYCLABLE MATERIALS - Enter the total number of recyclable materials which will be described in this report. Complete a separate Report Page 2 for each recyclable material and verify that the number of pages is the same as the total number listed here.

520. RECYCLABLE MATERIAL NUMBER - Enter the unique identification number of the recyclable material that is described on this page. The recyclable materials can be numbered sequentially, or by any other system as long as the numbers are not repeated or duplicated.

521. COMMON NAME (RECYCLABLE MATERIAL) - Enter the common name of the material recycled. This is the same as item 207, the Common Name on the Hazardous Materials Inventory - Chemical Description page.

522. QUANTITY DURING TWO YEAR REPORTING PERIOD - Enter the total quantity of this recyclable material recycled during the two-year reporting period. Round to nearest decimal. In this case, 1.4 tons = 1 ton reported.

523. UNITS - Enter the unit of measure for the quantity reported in item 522.

524. RECYCLABLE MATERIAL DESCRIPTION - Describe the recyclable material that was used in the recycling process, if not described in item 521, COMMON NAME.

525. RECYCLABLE MATERIAL PROCESS DESCRIPTION - Describe the recycling process and, if the recyclable material was used to provide a product, or was used as a substitute for a product, describe the beneficial use of the recyclable material.

526. AUTHORIZING PROVISION OF HSC SECTION 25143.2 - Enter the subdivision(s), and subparagraph(s) (if applicable) of HSC §25143.2 that served as the basis for the claim to exemption or exclusion. For example: HSC §25143.2(d)(2)(C).

527. BASIS FOR CLAIM TO EXCLUSION OR EXEMPTION - Explain the basis for the claim to an exclusion or exemption.

528. HAZARDOUS CONSTITUENT 1-4 - Describe up to four hazardous constituents of the recyclable material (use common name, if appropriate). If more than four constituents of the recyclable material are recycled, attach additional sheets using the same format as on the UPCF. (Report for constituents 2 through 4 in 534, 540, and 546.)

529. CONCENTRATION RECYCLABLE MATERIAL 1-4 - Enter the concentrations of up to four hazardous constituents of the recyclable material as a decimal number. (Report for constituents 2 through 4 in 535, 541, and 547.)

530. UNITS RECYCLABLE MATERIAL 1-4 - Enter the unit of measure of the concentration that is most appropriate, for up to four hazardous constituents of the recyclable material. (Report for constituents 2 through 4 in 536, 542, and 548.)

531. CONCENTRATION FINAL PRODUCT 1-4 - Enter the concentrations in the final product of up to four hazardous constituents of the recyclable material as a decimal number. (Report for constituents 2 through 4 in 537, 543, and 549.)

532. UNITS FINAL PRODUCT 1-4 - Enter the unit of measure of the concentration in the final product, for up to four hazardous constituents of the recyclable material. (Report for constituents 2 through 4 in 538, 544, and 550.)

533. FINAL PRODUCT/USES FOR CONSTITUENT 1-4 - Describe the final product(s) that resulted from the recycling process and how each product was beneficially used. (Report for constituents 2 through 4 in 539, 545, and 551.)

552. DOCUMENTATION - For offsite recyclers, check the box to indicate that documentation of known market is provided. Documentation is required pursuant to HSC §25143.10(a)(3)(A) to show that there was a known market for disposition of the recyclable material and any products manufactured from it.

Recyclable Materials Biennial Report Page 1

Complete this report if you recycle more than 100 kilograms per month of recyclable material under a claim that the material qualifies for an exclusion or exemption pursuant to HSC ∋25143.2. Facilities that recycle at the same location at which the material was generated (onsite recyclers) and facilities that recycle materials generated at an offsite location (offsite recyclers) must complete a report. Persons who send materials to another location to be recycled, and who do not recycle material onsite under a claim to an exclusion or exemption provided in HSC ∋ 25143.2, need not complete a report.

Offsite recyclers must complete one report for **each** generator from whom they receive recyclable materials. Complete a **separate** Page 2 of the Report for **each** recyclable material. When this report is submitted, provide a copy of the completed report to the generator of the material recycled.

Refer to HSC ∋25143.10 for reporting requirements for recyclers.

(Note: the numbering of the instructions follows the data element numbers that are on the UPCF pages. These data element numbers are used for electronic submission and are the same as the numbering used in 27 CCR, Appendix C, the Business Section of the Unified Program Data Dictionary.)

Please number all pages of your submittal. This helps your CUPA or local agency identify whether the submittal is complete and if any pages are separated.

1. FACILITY ID NUMBER - Leave this blank. This number is assigned by the CUPA. This is the unique number that identifies your facility.
2. EPA ID NUMBER - Enter your facility=s 12-character U.S. Environmental Protection Agency (U.S. EPA) or California Identification number. For facilities in California, the number usually starts with the letters ACA≅. If you do not have a number contact the DTSC Telephone Information Center at (916) 324-1781, (800) - 61-TOXIC or (800) 61-86942, to obtain one.
3. BUSINESS NAME - Enter the full legal name of the business.

500. BEGINNING DATE OF REPORTING PERIOD - Enter the beginning date of the reporting period for this report. This report is for two calendar years and is due on July 1 of every even-numbered year.

501. ENDING DATE OF REPORTING PERIOD - Enter the ending date of the reporting period for this report.

502. ONSITE RECYCLING - Check AYes≅ if the recycling facility recycles more than 100 kilograms per month of recyclable material generated onsite under a claim that the material qualifies for an exclusion or exemption pursuant to HSC ∋25143.2. Check ANo≅ if the recycling facility does not recycle onsite.

503. OFFSITE RECYCLING - Check AYes≅ if the recycling facility recycles more than 100 kilograms per month of recyclable material under a claim that the material qualifies for an exclusion, or exemption pursuant to HSC ∋25143.2, and that material was received from one or more offsite locations. Check ANo≅ if the recycling facility does not recycle material generated offsite.

504. OFFSITE GENERATOR NAME - If the generator is different from the recycler, enter the name of the person that generated the recyclable material. Complete a separate report for each generator.

505. OFFSITE GENERATOR EPA ID NUMBER - Enter the generator=s 12-character U.S. Environmental Protection Agency (EPA) identification number. If the generator needs but does not yet have an identification number, the owner or operator can contact the Telephone Information Center at (916) 324-1781.

506. OFFSITE GENERATOR STREET ADDRESS 507. OFFSITE GENERATOR PHONE NUMBER 508. OFFSITE GENERATOR CITY 509. OFFSITE GENERATOR STATE 510. OFFSITE GENERATOR ZIP CODE	Complete items **506 – 510** for each generator of recyclable material.

511. OFFSITE GENERATOR MAILING ADDRESS 512. CITY FOR MAILING ADDRESS 513. STATE FOR MAILING ADDRESS 514. ZIP CODE FOR MAILING ADDRESS	Complete items **511 – 514** if the mailing address for the offsite generator is different from the street address.

SIGNATURE OF CERTIFIER - The business owner/operator of the recycling facility shall sign in the space provided. This signature certifies that the signer believes that the information submitted is true, accurate, and complete.

515. DATE CERTIFIED - Enter the date that the certification was signed.
516. NAME OF DOCUMENT PREPARER - Enter the name of the person who prepared the report.
517. CERTIFIER NAME - Enter the full printed name of the certifier.
518. CERTIFIER TITLE - Enter the title of the person signing the report.

AB&I FOUNDRY
STORM WATER POLLUTION PREVENTION PLAN
CERTIFICATION

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

I further certify that this facility is in compliance with the requirements of the General Permit.

Signature: Robin Henningsen

Print: Robin Henningsen

Title: General Manager

Certification Date: 1/28/22

SWPPP AMENDMENTS

The following revision block is to be used when amending this plan to indicate the location and type of revision made.

Revision No.	Date	Revisions
1	June 2015	Updated SWPPP pursuant to new Industrial Storm Water General Permit Order No. 2014-0057-DWQ
2	November 2015	Updated Potential Pollution Sources
3	March 2016	Updated Maps, Administrative Changes, Updated Potential Pollution Source List
4	July 2016	Updated and Combined Tables 3 and 4 into one table pursuant to IGP requirements; Updated Table 6, 22, & 23; various administrative clarifications.
5	December 2016	Updated Table 3,4, &19; Fig 3, Fig 4 & Fig. 5, Section 1.4 and 1.5
6	June 2017	Facility Description, Certification, Combined Fig 3 and 5, Fig 4, Fig 5, Section 5.1.2, 6.1.2, 6.1.4, 6.1.7, 6.3, 7.2
7	November 2017	Table 19, 23, 25; Section 3.1, 6.3, 7.2, 8; Fig. 4, Fig. 5
8	December 2018	Updated Table 3, 9, 11, 18, 19, 20; Sections 2, 4.5, 5; Revised Appendices
9	July 2019	Updated tables 3, 7, 8, 19, 25; Revised sections 4.2, 4.3, 4.4, 6.1.7, 6.2.3, 7.2; Updated Appendix A and form 006-01-F01; Updated Figure 4 and Figure 5
10	September 2019	Revised sections 1.4, 4.1, 4.2, 5.1.1, 5.1.2, 5.1.3, 6.1.2, 6.1.7, 6.2.3, 7.2; Updated Tables 6, 7, 18, 19, 23, 24; Updated Figure 4 and Figure 5; Appendix A
11	February 2020	Updated Figure 4 and Figure 5. Updated Table 19. Updated Form 1. Revised sections 4.2, 6.2.3; Appendix A
12	June 2021	Updated Figure 4 and figure 5. Updated Table 7, Table 19 and Table 25. Updated Section 1.4, 4.1,4.2, 5.1.1, 6.2.3, 7.2
13	Sept 2021	Updated Section 8 PPT, SWPPP Checklist Change in staff/QISP
14	Jan 2022	Revised Section 1.4, Updated Table 4 & 5, Revised Section 6.1.7., Revised Section 6.23, Revised Table 7, Revised Section 7.2, Updated Table 23 & 24, Revised Appendix D

1. Introduction

This SWPPP, which pertains to the AB&I Foundry (AB&I) facility located at 7825 San Leandro Street in Oakland, California shall be maintained on site and made available, upon request, to a representative of the California Regional Water Quality Control Board (RWQCB) or from the local storm water management agency that receives storm water discharge from the facility. The location of the site is depicted in Figures 1 through 5 – Site Maps.

1.1 Compliance Checklist

A compliance checklist which includes a list of the General Permit Storm Water Pollution Prevention Plan Requirements, as defined in Section X of the General Permit, and the corresponding locations within this SWPPP where those requirements are addressed is included in Appendix A.

1.2 Background

California's Storm Water General Permit (General Permit) for Industrial Storm Water Discharges was adopted by the State Water Resources Control Board (SWRCB) on November 19, 1991. Facilities with the Standard Industrial Classification Codes (SIC) from 11 specific categories must comply with the general permit requirements. These facilities were required to declare intent to be included under the provisions of the State of California National Pollutant Discharge Elimination System (NPDES) General Permit No. CAS000001 for discharges of storm water associated with industrial activity, prepare and implement a SWPPP and a SWMIP, conduct monitoring, sampling and analysis, and submit an annual monitoring report. Requirements of the SWMIP were approved on September 17, 1992. The General Permit was re-issued in April 1997.

On April 1, 2014, the SWRCB adopted a new General Permit, which is effective on July 1, 2015. The SWRCB adopted an amendment to the NPDES Industrial Stormwater General Permit on November 6, 2018. This permit amendment became effective on July 1, 2020. This SWPPP was written pursuant to the requirements set forth in the Industrial General Permit Order 2014-0057-DWQ, as amended in 2015 and 2018.

The purpose of this SWPPP is to define a program, which, when implemented, will help identify sources of pollution that affect industrial storm water discharge quality and authorized non-storm water discharges that flow across the AB&I facility and describe and ensure the implementation of Best Management Practices (BMPs) to reduce or prevent pollution of storm water discharges from the plant. The SWPPP will be maintained by the team leader and/or Environmental Manager.

Pursuant to Attachment D of the IGP, the following Permit Registration Documents (PRDs) are required for Notice of Intent (NOI) of coverage under the IGP:

- NOI and signed Electronic Authorization Form;
- Site Map; and
- Storm Water Pollution Prevention Plan

1.3 Plan Reviews and Revisions

The Environmental Manager will review the SWPPP annually and update the plan when a change in design, construction, operation, or maintenance impacts the potential for pollutants to be discharged or when existing BMPs need improvement or enhancement to prevent pollution of storm water discharges.

1.4 Facility Description

AB&I is an iron foundry that operates in Oakland, California. The foundry produces cast-iron pipe, pipe fittings, and custom castings. Iron and steel scrap is melted in a cupola furnace and the molten metal is transferred to an electric-induction holding furnace.

The industrial operations at AB&I related to the production of pipe and fittings include:

- 12 core machines
- Cupola - scrap iron and coke
- 5 Centrifugal pipe machines
- 2 molding lines
- 3 asphalt pipe coating lines
- Fittings – grinding and asphalt coating carousel
- Pipe and fittings storage yard

AB&I also formerly operated a non-ferrous scrap metal recycling operation which included the unloading, sorting and storage of non-ferrous scrap metals. AB&I no longer conducts non-ferrous scrap metal recycling operations and conducts industrial activities as described in this plan.

Refer to Tables 1 through 3 for additional facility information. Figures 1 through 5 displays the Site Map of the AB&I facility.

Method for determining latitude/longitude:	USGS Topography Map
USGS topographic map (7.5' Quadrangles):	Oakland East, CA and San Leandro, CA
Is the facility located in Indian Country?	Yes ☐ ☑ No
Is this facility considered a Federal Facility?	Yes ☐ ☑ No
Operations since:	1941
Number of Team Members:	239
Production Operating Schedule:	Monday – Thursday 5:30 AM – 3:30 PM (2-week summer shut-down and 2-week winter shut-down)
Total Site Size	13.8 acres
Estimated area of industrial activity at site exposed to storm water:	12.8 acres (total area minus parking lot)
Streets/Railways/Rivers, etc. bordering the Facility:	East -San Leandro Street, West – Union Pacific Railroad, North – Hegenberger Road, South - Elmhurst Creek
Entrances onto Facility:	East – San Leandro St. (Gate 1,2, &3) West – Railroad spur gate
Primary SIC Code:	3321
Receiving Water	Elmhurst Creek via City of Oakland Municipal Storm Sewer System
303d Listing for HUC 10 Watershed:	Diazinon Dieldrin Dioxin compounds Organic Enrichment/Low Dissolved Oxygen Furan Compounds Mercury Selenium PCBs (dioxin-like) PCBs DDT Chlordane

The facility consists of numerous buildings or structures. The following table lists the building footprint size in square feet.

Table 4: Building and Structures

ID	Building	Size (ft^2)	Description
A	Locker Room	2,300	Ground level building with access doors on the North and South corners
B	Main Office/ Administration	11,900	Second story building with access stairways on the south side and San Leandro Street (NE). First level access doors on North, South, and NE side (2); large drive in area on South side (finished product storage)
C	Shipping Storage	12,000	Storage Area with large drive in doors on all side except South side
D	Core Room	6,500	Overhead covering containing openings on NW and SW sides
E	Foundry	105,000	Large overhead covering containing drive in openings on all sides
F	Pattern Shop	12,000	Ground level building with one drive in door and two small access doors on SW side; one small access door on S corner
G	Fabrication Shop/ Pattern Rigging	3,800	Large ground level building with drive in access doors on SW and NE sides
H	Stockroom/ Maintenance	6,500	Large two-level structure with two drive in and 2 small doors NE side; one access door on the NW and S corner
I	Rolling Stock	2,500	Ground level building with two drive in access doors on NE side and one drive in access door on NW side; one small access door on E corner, and one small access door on West Corner
J	Sand Storage	12,000	Large building with drive in access on the South and NE sides
K	Special Finishing	7,500	Ground-level building with drive in access on the West and South sides
L	Casting Storage	7,400	Storage for castings and shipping containers and pallets
M	Storage Building	5,500	Additional storage for Special Finishing castings
O	Oil Room	450	Painted steel building with 2 roll up access doors on SW side, and man door on S side.

No bake molding operations, previously referred to as building ID “N” are no longer conducted on site on site. References to no bake molding operations can be viewed in previous iterations of the stormwater pollution prevention plan.

The following table indicates which structures are currently connected to the municipal sanitary sewer system. The AB&I Foundry storm drain system is completely isolated from the sanitary sewer, and therefore, the sanitary sewer system does not serve as a potential source of pollutants to storm water runoff.

Table 5: Connections to Sanitary Sewer

ID	Building	None	Bathroom	Shower	Janitorial	Kitchen	Floor Drain
A	Locker Room		✓	✓	✓		✓
B	Main Office/ Administration		✓	✓	✓	✓	
C	Shipping Storage	X					
D	Core Room	X					
E	Foundry	X

M	Special Finishing Storage	X					
O	Oil Room	X					

1.5 Storm Drain System

The following table lists the storm water collection outfalls and the approximate drainage areas.

Table 6: Outfalls and Drainage Areas			
Percentage of facility that is impervious (i.e., pavement, buildings, etc.): 95 %			
Outfall[1]	**Location**	**Drainage Area[1] (ft^2)**	**NO Exposure Area**
Outfall 1:	Back Storage Area and Stormwater Treatment Area	130,680	
Outfall 2:	Cupola Sump	156,816	
Outfall 3:	Shipping/Process Water Treatment Area	152,460	
Outfall 4:	Parking Lot –(non-industrial)	52,272	X
Outfall 7 and 8:	77th Avenue fitting storage area	100,188	

[1]Drainage area from StormwateRx *Stormwater Management Conceptual Design* dated July 16, 2013

Discharges of storm water can occur at several drop inlet connections to the City of Oakland Municipal storm sewer system ultimately draining to Elmhurst Creek. The outfall locations and drainage areas are depicted in Figure 4.

Discharges from the Storm Water Treatment system at Outfall 1 are to the City of Oakland Municipal storm sewer system at 77th Street. In 2014, AB&I modified the plumbing in drainage areas serving Outfall 1, Outfall 2, Outfall 3, and Outfalls 7 and 8 to combine all runoff generated from storm water falling in those drainage areas at a rate equal to, or below 0.2 inches/hour to Outfall 1 to the Storm Water Treatment System. Flows exceeding this design capacity are bypassed to the City of Oakland Municipal storm sewer system at the 77th Street municipal storm drain at Outfall 1; or at Outfall 3, when rainfall exceeds apportioned design flow at the Outfall 3 drainage area.

When needed for reuse, storm water collected in the sump at Outfall 2 is transferred by a float-controlled pump to the Facility's process water treatment system to be recycled and used for in-plant processes. Flows more than recycling requirements and exceeding 0.2 inches/hour is pumped to the Storm Water Treatment System and bypassed through the City of Oakland municipal storm sewer system along 77th Street.

When needed for reuse, storm water collected from the Outfall 3 drainage areas is transferred manually by an air diaphragm pump to the process water treatment system to recycle and use the water for plant processes. Flows more than recycling requirements and exceeding permit design capacity for the Storm Water Treatment System for these areas are bypassed through Outfall 3 to the city of Oakland 's municipal storm sewer system along 81st Street. Discharges to City of Oakland's municipal storm water sewer system along 77th Street municipal storm drain can also occur at bypass conditions at Outfall 7 and Outfall 8. These bypasses occur when storm water flows exceed the apportioned design capacity for these areas pumped to the Storm Water Treatment System at Outfall 1.

The facility has modified the Team Member Parking area of the facility draining into Outfall 4 to isolate the area from industrial use, such that all storm water runoff in that area be directed to the northwest as sheet flow, which conveys due west to outfalls 7 and 8.

1.6 Related Facility Plans

The facility also maintains other regulatory plans and compliance documents, which have requirements related to the storm water management requirements in the General Permit. These include the following:

- Spill Prevention, Control, and Countermeasure (SPCC) Plan; and
- Alameda County Department of Environmental Health Hazardous Materials Business Plan (HMBP) that inventories all hazardous/dangerous materials stored on-site. The HMBP includes a Consolidated Emergency Response / Contingency Plan.

3. List of Industrial Materials

3.1 List of Industrial Materials Stored or Handled at the Facility

The General Permit requires preparation of a list of industrial materials that are stored or handled on site. An inventory of industrial materials used in the manufacturing process is provided in the table below.

Table 7: Inventory of Industrial Materials Stored or Handled on Site

Material Description	Storage Location(s); Typical Quantity Stored / Physical Characteristics, Typical Frequency of Storage	Receiving Location(s); Typical Quantity Received; Typical Frequency of Receiving	Shipping Location(s); Typical Quantity Shipped; Typical Frequency of Shipping	Handling Location(s); Typical Quantity Handled; Typical Frequency of Handling
Zip-Slip 109W Release Agent	Core Room	Stockroom	N/A - used onsite	Core Room
	Quantity: 55 gallons (all items listed in gallons below are liquid)	Quantity: 55 gallons		Quantity: 55 gallons
	Frequency: Daily	Frequency: As needed		Frequency: Daily
Satin Kote 303 G	Core Room	Stockroom	N/A - used onsite	Core Room
	Quantity: 220 gallons	Quantity: 220 gallons		Quantity: 55 gallons
	Frequency: Daily	Frequency: No longer ordered, using last of current supply		Frequency: Daily
Core Butts / Broken Sand Cores	Core Room	N/A - generated onsite	N/A - recycled onsite	Core Room
	Quantity: 10 tons (solid / powder)			Quantity: 2 tons
	Frequency: Weekly			Frequency: Daily
Silica Sand / Ground Silica / Crystalline Silica	Core Room	Stockroom	N/A - used onsite	Core Room
	Quantity: 36 supersacks (solid / powder)	Quantity: 14 supersacks		Quantity: 14 supersacks
	Frequency: Daily	Frequency: Daily		Frequency: Daily
Dust - Cyclone (270 DISA)	Sand Storage	N/A - generated onsite	Sand Storage Area	Molding
	Quantity: 16 tons (solid / powder)		Quantity: 16 tons	Quantity: 4 tons
	Frequency: Weekly		Frequency: Weekly	Frequency: Daily
Dust - Cyclone (2013 DISA)	Sand Storage	N/A - generated onsite	Sand Storage Area	Molding

4. Description of Potential Pollution Sources

The General Permit requires a pollutant source assessment to identify industrial materials used and industrial activities performed with the potential to contribute to pollutants in storm water discharges. As described in the General Permit, the assessment must include review of the following:

- The areas of the facility with likely sources of pollutants in industrial storm water discharges and authorized NSWDs;
- The pollutants likely to be present in industrial storm water discharges and authorized NSWDs;
- The approximate quantity, physical characteristics (e.g., liquid, powder, solid, etc.), and locations of each industrial material handled, produced, stored, recycled, or disposed;
- The degree to which the pollutants associated with those materials may be exposed to, and mobilized by contact with, storm water;
- The direct and indirect pathways by which pollutants may be exposed to storm water or authorized NSWDs;
- All sampling, visual observation, and inspection records;
- The effectiveness of existing BMPs to reduce or prevent pollutants in industrial storm water discharges and authorized NSWDs;
- The estimated effectiveness of implementing, to the extent feasible, minimum BMPs to reduce or prevent pollutants in industrial storm water discharges and authorized NSWDs; and,
- The identification of the industrial pollutants related to the receiving waters with 303(d) listed impairments (identified in Appendix 3 of the General Permit) or approved TMDLs that may be causing or contributing to an exceedance of a water quality standard in the receiving waters.

Based on this source assessment, potential pollutant sources at the Facility should be identified and summarized in the following sections. Sections 6.0 thru 6.3 include BMPs that have been implemented at the site to minimize the potential for off-site discharge of the pollutants associated with these activities.

4.1 Industrial Processes

The facility's main industrial processes, including mold and core production, metal charging and melting, hot metal pouring, mold cooling and shakeout and finishing and grinding operations are contained inside the Foundry structure as noted in Table 4. Other processes such as drum storage, empty drum storage, management of waste and recyclable metal dust and most maintenance activities are conducted beneath structural overhead coverage. By the nature of these processes and the types of materials which are used, however, even when these processes are conducted indoors, there is, nevertheless, potential to impact the outdoors environment due to the tracking of sand and metal particulate by vehicle and foot traffic and fugitive emissions. The casting storage area, the storage of some equipment and finished product are not protected by structural overhead coverage. In these cases, the storage of such items is minimized, and the items are stored on pallets to provide ground clearance. Scrap and coke are not protected by structural overhead coverage.

They are stored in concrete block containment bays to minimize their contact with storm water. Table 19 includes a list of potential pollutant sources and the approximate quantities of each material or activity.

4.2 Material Handling and Storage Areas

Routine material handling at AB&I includes new sand and casting supplies storage and handling, as discussed above. Other material handling activities include the handling of spent molding sand, recyclable metal wastes, baghouse dust, and slag waste materials. These are all potential sources of dust, including metal particulate, which can be dispersed by foot and forklift traffic during normal operations. A list of material handling and storage areas and their associated Reference Map IDs can be found in Table 19.

Transfer of Spent Molding Sand

Waste molding sand will be loaded directly into waste trucks under cover in the Cupola area except when needed for waste sand mixing. Under these circumstances, waste sand from molding is transferred from the covered DISA 2013 area to the Sand Storage area. AB&I will take precautions during transport of waste sand from the DISA 2013 area to the Sand Storage area. The process area and the traffic patterns are swept on a routine basis.

Slag Handling

Impurities in the metal charges rise to the tip of the molten metal during the melting process. The impurities which are called slag are skimmed off the top of the molten metal and the slag falls off a conveyor into a bin (Figure 5 - Map ID #31). The slag bin is then transferred to the sand storage area where it is stored prior to disposal offsite. The area around the slag handling area is swept routinely to minimize the tracking of particulate materials.

Recyclable Metals

Machining waste consisting of grindings and metal turnings are stored in the Cast Finishing area. Machine Shop filings are also stored in the Pattern Shop and Special Finishing Buildings. These materials are used as scrap metal. The materials are stored in metal 55-gallon drums.

Additional materials and storage areas along with the quantity and location of each material are listed in Table 19.

4.3 Dust and Particulate Generating Activities

Waste streams routinely generated at AB&I correspond with dust generating activities and potential sources of metal particulate, including iron. They include:

- Particulate dust from metal melting operations;
- Particulate dust from control of emissions from the sand handling and molding processes;
- Particulate dust from the control of emissions from the sand reclamation process;

- Particulate dust from the removal of casting sprues, gates and risers from saw cutting and from the cast finishing and grinding processes;
- Metal Melting Slag Waste; and
- Welding.

Other waste streams routinely generated at AB&I include general trash from manufacturing and office operations.

Particulate Dust from Baghouse 1 through 5

Baghouse #1 controls particulate matter (PM) emissions from the sand handling system, Baghouse #2 controls PM emissions from grinding and cast finishing operations, Baghouse #3 controls PM emissions from Wheelabrator and oscillator operations, Baghouse #4 controls PM emissions from the two Didions, and Baghouse #5 controls PM emissions from the 270 DISA and 2013 DISA. The dust from all five baghouses are transferred via screw conveyors and are commingled into a single roll-off bin (approximately 20 yd3) (Figure 5 - Map ID #34) located between Baghouse #2 and Baghouse #3. The roll-off bin is transferred via truck to the Sand Storage area located at the West corner of the Foundry at least once per day. The Sand Storage area is covered by a roof.

Particulate Dust from Baghouse 6

Baghouse 6 controls PM emissions from the shakeout operation from the oscillator. Baghouse 6 dust is emptied from the baghouse hopper into a super sack within a bin that is located at the base of the baghouse. The bin is then emptied in the Sand Storage area.

Particulate Dust from Cupola Baghouse

Cupola PM emissions are controlled by the Cupola Baghouse (Modules 1 through 6). Cupola Baghouse dust is transferred mechanically from the baghouse hoppers to an adjacent Dust Silo. Dust in the Silo is reinjected back into the Cupola. If reinjection slows and the Dust Silo becomes full, the dust is emptied into a 20 yd3 hazardous waste roll-off bin (Figure 5-Map ID #36) for disposal by an outside contractor.

Particulate Dust from Fume Baghouse

PM emissions from molten iron furnaces are controlled by the Fume Baghouse. Fume baghouse dust is emptied from the baghouse hopper approximately once per month into a super sack within a bin. The super sack is then contained in the Cupola Baghouse 20 yd3 hazardous waste bin.

The area around each baghouse is thoroughly swept after each dust-handling event and in between events when necessary.

4.4 Significant Spills and Leaks

The facility has evaluated the areas where spills and leaks could occur and has implemented BMPs accordingly and as discussed in Section 5 of this SWPPP. AB&I is aware that discharges and significant spills are reportable occurrences and records will be kept as part of this SWPPP, should

they occur. AB&I maintains a HMBP / Consolidated Emergency Response / Contingency Plan with the Alameda County Department of Environmental Health. Presented below is information on significant spills or leaks that have occurred at the Facility in the past 5 years; included are industrial materials that have spilled or leaked in significant quantities and have discharged from the facilities storm water conveyance, toxic chemicals (listed in 40 CFR, Part 302) that have been discharged to storm water as reported on US EPA Form R, oil and hazardous substances in excess of reportable quantities (see 40 CFR, Parts 110, 117, and 302), and industrial materials that have spilled or leaked in significant quantities and had the potential to discharge.

Table 8: Documentation of Significant Spills and Leaks									
Date	**Spill or Leak?**	**Location (as indicated on Site Map)**	**Identification of Material spilled or leaked**	**Discharge or Potential Discharge listed above**	**Quantity Spilled or Leaked**	**Quantity discharged to storm water conveyance**	**Response taken Remediation or cleanup actions**	**Approximate remaining quantity of material that has the potential to be discharged**	**Measured taken to prevent recurrence**
12/04/17	Spill	Hot Asphalt Dip Tanks	Hot Asphalt	Spill in excess of reportable quantities	1550 gallons	0	The spill occurred within the containment walls and the dip was allowed to cool and solidify. It was then cleaned up.	0	New procedures and additional training.

4.5 Non-Storm Water Discharges

In addition to monthly visual monitoring, AB&I evaluates for the presence of non-storm water discharges during the Annual Comprehensive Facility Compliance Evaluation (ACFCE). The findings are documented on the Monthly Non-Storm Water Discharge Observation Forms and on the ACFCE, included in Appendix B of this SWPPP.

Table 9: Annual Evaluation – Non-Storm Water Discharges	
ACFCE:	Annual
Group Leader Inspection:	One on-site inspection conducted every year
Description:	Comprehensive assessment of pollutant sources and outfalls. Evaluating the effectiveness of structural controls and BMPs
Outfalls observed:	Outfall 1, Outfall 2, Outfall 3, Outfall 7, and Outfall 8
Actions:	Any corrective actions are documented and remedied within 30 days of inspection.

The following potential non-storm water discharge sources were identified:

Table 10: Non-Storm Water Discharge Evaluation			
Activity/Source	**Authorized Discharge**	**Affected Outfalls**	**Findings/ Actions**
Outside drinking fountains located throughout foundry	*Yes*	2,3	Does not generate enough volume to collect in the sumps discharge to outfall. Areas are covered and are not likely to co-mingle with storm water.
Uncontaminated condensate from air conditioners and compressors	*Yes*	1,2	Does not generate enough volume to collect in the sumps discharge to outfall. Outside compressors have surrounding containment.
Condensate from the outside storage of liquid nitrogen and oxygen	*Yes*	1	Enclosure is not contained and water drains into sump. The run-off does not generate enough volume to discharge to the outfall.

The potential for unauthorized discharges is low due to the controls in place (sumps, pump disconnects, berms, operational controls, etc.) to prevent discharges from occurring.

4.6 Erodible Surfaces

Currently over 95 percent of the AB&I facility is impervious. Sediment is controlled prior to reaching the outfall sumps by the following measures:

- Regular sweeping throughout the foundry;
- Storing core sand and waste sand under a roof; and
- Regular clean-up of sand near foundry storm drains. Specific sediment control BMPs are listed in Table 19.

5. Assessment of Potential Pollutant Sources

5.1 Assessment of Potential Pollutant Sources

The following potential source areas of storm water contamination were identified and evaluated:

- Outfall 1 Area
- Outfall 2 Area
- Outfall 3 Area
- Outfall 7 Area
- Outfall 8 Area

There is no industrial activity in the Team Member parking lot; therefore, the Outfall 4 drainage area is an area with no exposure. Locations of each area of concern for this site are included on the Site Map and are described in the following subsections. A detailed description of all minimum and advanced BMPs may be found in Table 19.

5.1.1 Outfall 1 Area

The following material or activity may be a potential pollution source that drains to Outfall 1: Scrap Handling and Storage, Foundry Coke, Limestone, and Silicon Carbide Storage, Core Sand and Core Storage, Diesel and Gasoline Fueling and Storage, Oil Storage and Dispensing, Used Oil Storage, Flammable Waste Storage, Pattern Shop and Special Finishing Shop Filings, Truck Loading, Mixing Waste Sand, Used Cores Disposal, Ferrous Slag, Baghouse 1-5 Dust, Sludge Disposal (bin transfer), Mobile Equipment Maintenance, Air Compressors, Coated Pipe and Castings, and Equipment Storage. The pollutants (Metals, Total Suspended Solids, and Oil/Grease) likely to be present in industrial storm water discharges for each material or activity are included in Table 19. The approximate quantity, physical characteristic (liquid, powder, solid), and the location of each industrial material or activity are also listed in Table 19. BMPs for these potential pollution sources include inspections, secondary containment, routine sweeping, structural overhead coverage, and water spray for dust control. Runoff generated from storm water falling in the Outfall 1 drainage area at a rate equal to, or below 0.2 inches/hour will also be processed by the Storm Water Treatment System prior to being discharged offsite through the City of Oakland municipal storm water sewer system. In case of a bypass, procedures are described in Table 20 in Section 7.2. Based upon the BMPs discussed above for the Outfall 1 area, the effectiveness of existing BMPs to reduce or prevent pollutants in storm water is believed to be adequate.

5.1.2 Outfall 2 Area

The following material or activity may be a potential pollution source that drains to Outfall 2: Cupola Charging, Scrap Handling and Storage, Rail Car Unloading, Core Sand, Emulsified Asphalt, Steel Shot, Mixing Waste Sand, Used Cores Disposal, Ferrous Slag, Coke Breeze, Cupola Drop-Out, Baghouse 1-5 Dust, Baghouse 6 Dust, Fume Baghouse Dust, Cupola Baghouse Dust, Forklift Maintenance, Mobile Equipment Maintenance, Air Compressors, and Coated Pipe and Castings. The pollutants (Metals, Total Suspended Solids, and Oil/Grease) likely to be present in

industrial storm water discharges for each material or activity are included in Table 19. The approximate quantity, physical characteristic (liquid, powder, solid), and the location of each industrial material or activity are also listed in Table 19. BMPs for these potential pollution sources include inspections, secondary containment, routine sweeping, structural overhead coverage, water spray for dust control, and drip pans and pads. Runoff generated from storm water falling in the Outfall 2 Area drainage area at a rate equal to, or below 0.2 inches/hour will also be processed by the Storm Water Treatment System prior to being discharged offsite through the City of Oakland municipal storm sewer system. Based upon the BMPs discussed above for Outfall 2, the effectiveness of existing BMPs to reduce or prevent pollutants in storm water is believed to be adequate.

5.1.3 Outfall 3 Area

The following material or activity may be a potential pollution source that drains to Outfall 3: Rail Car Unloading, Hot Asphalt Tanker Unloading, Hot Dip Pipe Coating, Ink and Cleaner Pipe Stenciling, Diesel Fueling and Storage, Non-Contact Process Water Cooling, Contact Process Water Treatment, Sludge Disposal (bin transfer), Baghouse 6 Dust, Coated Pipe and Casting, Material Storage, Hot Dip Heating Oil, and Mist-Collector Condensate. The pollutants (Metals, Total Suspended Solids, and Oil/Grease) likely to be present in industrial storm water discharges for each material or activity are included in Table 19. The approximate quantity, physical characteristic (liquid, powder, solid), and the location of each industrial material or activity are also listed in Table 19. BMPs for these potential pollution sources include inspections, secondary containment, routine sweeping, structural cover, programmable logic controller-controlled overflow alarms, and recycling. Runoff generated from storm water falling in the Outfall 3 drainage area at a rate equal to, or below 0.2 inches/hour will also be processed by the Storm Water Treatment System prior to being discharged offsite through the City of Oakland municipal storm sewer system. Based upon the BMPs discussed above for the Outfall 3 Area, the effectiveness of existing BMPs to reduce or prevent pollutants in storm water is believed to be adequate.

5.1.4 Outfall 7 Area and Outfall 8 Area

The following material or activity may be a potential pollution source that drains to Outfall 7 and Outfall 8: Coated Pipe and Castings, and Equipment Storage. The pollutants (Metals, Total Suspended Solids, and Oil/Grease) likely to be present in industrial storm water discharges for each material or activity are included in Table 19. The approximate quantity, physical characteristic (liquid, powder, solid), and the location of each industrial material or activity are also listed in Table 19. BMPs for these potential pollution sources include inspections, secondary containment, routine sweeping, and structural overhead coverage, concrete berms and drain guards, and draining oil from unused equipment. Runoff generated from storm water falling in the Outfall 7 and 8 drainage areas at a rate equal to, or below 0.2 inches/hour will also be processed by the Storm Water Treatment System prior to being discharged offsite through the City of Oakland municipal storm sewer system. If a bypass is necessary, procedures are described in Table 20 in Section 7.2. Based upon the BMPs discussed above for the Outfalls 7 and 8 drainage areas, the effectiveness of existing BMPs to reduce or prevent pollutants in storm water is believed to be adequate.

6. Best Management Practices (BMP)

This section describes the storm water management controls and BMPs that are in place at the facility. The BMPs are in place to reduce the potential of storm water impacts due to on-site industrial activities.

6.1 Minimum BMPs

6.1.1 Good Housekeeping

AB&I will observe all outdoor areas associated with industrial activity; including storm water discharge locations, drainage areas, conveyance systems, waste handling/disposal areas, and perimeter areas impacted by off-facility materials or storm water run-on to determine housekeeping needs. Any identified debris, waste, spills, tracked materials, or leaked materials shall be cleaned and disposed of properly. Specific housekeeping BMPs for each potential pollution source is listed in Table 19. Foundry-wide housekeeping BMPs include:

- Catch basins and floor drains are regularly inspected and cleaned;
- All storm drains and outfall screens are routinely inspected and cleaned;
- Sweeping with an AB&I vacuum street sweeper is performed routinely on all accessible impervious areas;
- Spill kits are inspected monthly and re-stocked if needed;
- Material storage containers are labeled to indicate the contents and NFPA/HMIS hazard levels;
- Containment sumps are inspected monthly;
- All hazardous waste storage areas are inspected weekly;
- All waste material, including trash and recyclable materials are stored in roll-off bins. The bins are picked up regularly.

Table 11: Good Housekeeping						
Good Housekeeping Minimum BMPs (section X.H.1.a of IGP)	**Site Specific BMP Description**	**Area(s) Implemented**	**Tools / Equipment**	**Frequency**	**Person(s) Responsible**	**Actions performed in lieu of BMP**
Observe and maintain outdoor industrial activity areas	Inspection conducted as required during monthly BMP inspection	Foundry-wide	N/A	Monthly	Environmental Department (Inspections), each Department responsible for their activities	N/A
Minimize or prevent material tracking	-Sweeping -Material Handling Indoors	Foundry-wide	Sweeper	Routinely	All Team Members	N/A
Minimize dust generated from industrial activities	-Water Sprays -Structural overhead coverage -Containers	-Baghouses -Material Storage Areas -Coke Breeze	Water Sprays and Drums	Daily	Environmental, Pipe, Maintenance, and Cupola Department	N/A
Clean up areas affected by rinse / wash water	Sweeping	Foundry-wide	Sweeper	Routinely	All Team Members	N/A
Cover stored industrial materials that can be readily mobilized by contact with storm water	-Structural overhead coverage	Material Storage Areas	N/A	Daily	All Departments	N/A
Contain non-solid industrial materials or wastes that can be transported by wind or storm water	-Structural overhead coverage	Material Storage Areas	N/A	Daily	All Departments	N/A
Prevent disposal of rinse/wash waters into the storm water conveyance system	Catch-basins	Foundry-wide	Pressure Wash	During rinsing	All Team Members	N/A
Minimize storm water discharges from non-industrial areas that contact industrial areas	Team Member parking lot slopes towards Outfall 4 drain	Parking lot	N/A	N/A	N/A	N/A
Minimize flows of offsite storm water and NSWDs into material handling areas	Concrete berms, drainage sumps, drain elevations	Foundry-wide	N/A	N/A	N/A	N/A

6.1.2 Preventative Maintenance Program

Table 12: Preventative Maintenance Program

Preventative Maintenance Minimum BMPs (section X.H.1.b of IGP)	Site Specific BMP Description	Area(s) Implemented	Tools / Equipment	Frequency	Person Responsible	Actions performed in lieu of BMP
Identify equipment and systems used outdoors that may leak pollutants	Preventative Maintenance Program	Foundry-wide	Varies	Weekly, Monthly, Quarterly, Semi-Annual, Annual	Maintenance Department, Environmental Department	N/A
Observe the equipment and systems used outdoors to detect leaks or conditions that may result in leaks	Equipment is inspected routinely based on Preventative Maintenance Program in place	Foundry-wide	N/A	Weekly, Monthly, Quarterly, Semi-Annual, Annual	Maintenance Department, Environmental Department	N/A
Establish a schedule for maintenance of equipment and systems used outdoors	Preventative Maintenance Program includes maintenance schedule	Foundry-wide	Varies	Weekly, Monthly, Quarterly, Semi-Annual, Annual	Maintenance Department, Environmental Department	N/A
Establish procedures for maintenance and repair of equipment and systems when conditions exist that result in development of spills or leaks	Preventative Maintenance program allows for creation of Work Orders to repair equipment when leaks occur, leaks cleaned ASAP	Foundry-wide	Preventative Maintenance Program	As needed	Maintenance Department	N/A

An effective Preventative Maintenance Program is an important aspect of any BMP control system. Well-maintained and routinely inspected equipment is less likely to cause problems that result in accidents. AB&I has a preventative maintenance program in place that is constantly being upgraded to satisfy the overall needs of the BMP Program.

Maintenance, inspections and repair will be performed to ensure that all grade surfaces, secondary containment units, drainage basins and other protective devices identified in the site maps are maintained in good and effective conditions and are promptly repaired as necessary. A record will be kept of any maintenance inspection and/or work and will include the date the inspection/work was performed and the person(s) performing the inspection/work. Maintenance, inspection, and repair will include, but not be limited to the following equipment and systems used outdoors that have been identified as ones that may spill or leak pollutants:

- Baghouses 1-5;
- Baghouse 6
- Cupola Baghouse;

- Fume Baghouse;
- Mist Eliminator;
- Contact Pumps 1,2,3 and 4;
- Hy-Vacuum System;
- Outfall 1 sump pump;
- Outfall 2 sump pump;
- Storm water sump pump;
- Storm Water System process pumps;
- Emergency generator;
- Water Treatment Storm sump pump;
- Hydro-Pneumatic tank;
- TETS Feeder;
- NC Cooling Tower;
- Non-Contact Pump 1, 2 and 5;
- Concrete surfaces;
- Unused Equipment and Scrap Metal Storage Area;
- Plant Water Cooling Equipment and Piping;
- Plant Air compressors;
- Pneumatic Transfer Equipment; and
- Forklifts, frontend pay loaders, roll-off trucks, and other heavy equipment operated onsite.

Maintenance BMPs include:

- Machinery and vehicles are inspected daily by the operators. Leaks or potential problems are reported to the department supervisors and repairs are promptly scheduled;
- All team members involved in vehicle and equipment maintenance are trained in AB&I waste disposal procedures;
- All equipment containing more than 55 gallons of oil has been inventoried in the SPCC Plan;
- Maintenance of structural controls and BMPs are performed as needed. All records of maintenance and repairs are maintained by the environmental and maintenance departments; and
- AB&I Foundry has a preventative maintenance system in place for all applicable equipment onsite.

6.1.3 Spill and Leak Prevention and Response

AB&I will minimize the potential for leaks, spills and other releases that may be exposed to storm water and develop response plans if such spills occur. The facility will implement the following BMPs:

- Spill prevention and response is covered under the AB&I SPCC Plan. AB&I maintain work instructions for spill/incident response and notification.
- On an annual basis, AB&I submit a Hazardous Materials Business Plan (HMBP) to the

local CUPA (Certified Unified Program Agency - Alameda County Department of Environmental Health) that inventories all hazardous/dangerous materials stored on-site.

- All bulk oil storage area containments that are not covered have locking valves or must be manually pumped to remove uncontaminated storm water. Containment areas are inspected weekly.
- All team members involved in vehicle and equipment maintenance are trained in spill prevention and response.

Specific spill prevention BMPs are listed in Table 13.

Table 13: Spill and Leak Prevention Response

Spill and Leak Prevention and Response Minimum BMPs (section X.H.1.c of IGP)	Site Specific BMP Description	Area(s) Imple-mented	Tools / Equipment	Frequency	Person Responsible	Actions performed in lieu of BMP
Establish procedures and/or controls to minimize spills and leaks	SPCC Plan includes procedures for minimizing spills and leaks	Foundry-wide	N/A	N/A	Environmental Department	N/A
Develop and implement spill and leak response procedures to prevent industrial materials from discharging through storm water conveyance system. Clean up spills and leaks promptly and dispose of properly.	All Team Members are trained using our PureSafety program to contain and clean up spills and leaks and dispose of the waste properly	Foundry-wide	Spill kit used as needed	Annual Training	Environmental Department	N/A
Identify and describe needed spill and leak response equipment and equipment maintenance procedures.	Spill Kits containing pads, socks, and sump skewers are located near all bulk tank locations. Equipment maintenance procedures are a part of our Preventative Maintenance Program.	Foundry-wide	Spill Kit	Spill Kits are restocked monthly. Maintenance procedures are included in the Preventative Maintenance Program	Maintenance Department, Environmental Department	N/A
Identify and train appropriate spill prevention and response personnel	All Team Members are trained using our PureSafety program to respond to and cleanup spills	Foundry-wide	PureSafety	Annual	Environmental Department	N/A

6.1.4 Material Handling and Waste Management

Table 14: Material Handling and Waste Management

Materials Handling and Waste Management Minimum BMPs (section X.H.1.d of IGP)	Site Specific BMP Description	Area(s) Implemented	Tools / Equipment	Frequency	Person(s) Responsible	Actions performed in lieu of BMP
Prevent or minimize handling of industrial materials or wastes that can be readily mobilized by contact with storm water	Overhead coverage, sweeping, berms	Material Storage Areas, Sand Storage Building	Sweeper	Routinely	All	N/A
Contain all stored non- solid industrial materials or wastes that can be transported or dispersed by the wind or contact with storm water	Overhead coverage, sweeping, berms	Material Storage Areas, Sand Storage Building	Sweeper	Routinely	All	N/A
Cover industrial waste disposal and industrial material storage containers when not in use.	Overhead coverage, containerized waste inspections	Foundry-wide	N/A	Monthly	All	N/A
Divert run-on and storm water generated from within the facility away from stockpiled materials	Materials stored on pallets, concrete berms	Material Storage Areas, Sand Storage Building	N/A	Daily	All	N/A
Clean spills that occur during handling in accordance with spill response procedures	SPCC Plan includes spill response procedures, all Team Members trained to clean up spills	Foundry-wide	Spill Kits (pads, skewers, socks, etc.)	As needed	All	N/A
Observe and clean outdoor material/waste handling equipment or containers	Sweeping, cleaning mobile equipment, preventative maintenance program	Foundry-wide	Sweeper, rags, pressure wash	As needed	All	N/A

Material handling outdoors and exposed consists of the off-loading of raw materials from trucks in front of the Stockroom, truck off-loading of liquid materials and on-loading of liquid waste materials at the Oil Room area, and offloading of new sand near the Material Storage area. Foundry coke and limestone are transported from their storage locations to the Cupola by a front pay loader. Diesel Storage Tanks are refilled in two locations. Hot Asphalt Dip is refilled at the tank location. Waste slag is handled outdoors near the Cupola and is transferred to the Sand Storage Building. Spent molding and core sand is transported from the Core Room to the Sand Storage area. Castings are brought from the Core Storage area to the Core Room by a forklift. BMPs employed to prevent or minimize the impacts that these potential sources have on storm water quality are described separately.

Production staff is instructed in good housekeeping related to maintaining their work areas in a clean and orderly manner, which includes the use of absorbent materials, absorbent socks and mats, and sweeping. Team Members are trained to cleanup small dry chemical and liquid spills.

6.1.5 Erosion and Sediment Control

The facility consists of 95 percent impervious surfaces. The pervious surface includes the southern scrap storage pile. Given the flat terrain, concrete block containment and the observed infiltration of incident rainfall, there is little potential for any soil erosion.

However, should AB&I identify erodible surfaces at the facility, AB&I will implement the following as necessary: effective wind erosion controls, provide effective stabilization for erodible surfaces prior to a forecasted storm event, maintain effective perimeter controls to reduce or eliminate tracking, and divert run-on and storm water generated from within the facility away from all erodible materials.

Table 15: Erosion and Sediment Control

Erosion and Sediment Control Minimum BMP (section X.H.1 of IGP)	Site Specific BMP Description	Area(s) Implemented	Tools / Equipment	Frequency	Person(s) Responsible	Actions performed in lieu of BMP
Implement effective wind erosion controls	N/A	N/A	N/A	N/A	N/A	N/A
Provide effective stabilization for inactive areas, finished slopes, and other areas prior to a forecasted storm event.	N/A	N/A	N/A	N/A	N/A	N/A
Maintain effective perimeter controls and stabilize site entrances / exits to control discharges / tracking of erodible materials.	N/A	N/A	N/A	N/A	N/A	N/A
Divert run-on and storm water generated from within the facility away from erodible materials	N/A	N/A	N/A	N/A	N/A	N/A
If sediment basins are implemented, ensure compliance with the design storm standards in Section X.H.6 of IGP.	N/A	N/A	N/A	N/A	N/A	N/A

6.1.6 Team Member Training

The Environmental Manager is responsible for implementing team member training programs related to storm water management. The training program will include the following elements:

- **Storm Water Pollution Prevention Team Training** consisting of reviewing the purpose and objectives of the AB&I Foundry Storm Water Management Program and the requirements of the General Permit. The training will be performed by a QISP and feature the site specific potential sources of storm water pollution and the BMPs employed to minimize their impact to storm water quality. The site-specific monitoring and reporting requirements, including storm water sampling and analysis will also be discussed. Brief refresher training related to the basic elements of the program will be conducted annually. These will include a performance evaluation of the previous year including the results of the monitoring and reporting program and areas where improvement is needed.

- **Storm Water SWPPP/BMP Training** consisting of a computer-based training performed by a QISP assigned to all personnel for implementing and maintaining designated BMPs. This AB&I bilingual storm water training will be repeated annually or as necessary when team member roles and responsibilities are changed or when new team members are added. The Environmental Department shall keep a log of the training given. All team members work in areas where industrial materials or activities are exposed to storm water, or are responsible for implementing activities necessary to meet the conditions of the facility's permit.

- **New Team Member Orientation –** The environmental department will coordinate with the Human Resources Department to ensure that new team members receive storm water management awareness training, which would include an opportunity to review the SWPPP and discuss any questions with the Environmental Department.

- **Corrective Action Training –** Based on the results of Annual Evaluations, monitoring observations and inspections, the Environmental Department will determine the need to conduct additional training with respect to implementing new BMPs or to enhance or improve implementation of existing BMPs. This training can be done as needed on a one-on- one basis or at group forums, such as department meetings or information exchange meetings.

The Environmental Department will keep a record of all training activities conducted. The records will include the type of training given as described above, the date, the subjects discussed, and the persons who received the training.

The training schedule shall be as follows:

- **Storm Water Pollution Prevention Team Training/Refresher Training**
  Annually

- **BMP Training**

Annually and as needed thereafter based on changes in staff roles and responsibilities or new hires

- **New Team Member Orientation Training**
  Within the first two weeks of employment

- **Corrective Action Training**
  Monthly at department meetings or as needed

Table 16: Team Member Training

Team Member Training Minimum BMPs (section X.H.1 of IGP)	Site Specific BMP Description	Person(s) Responsible	Actions performed in lieu of BMP
Identify which personnel need to be trained, their responsibilities, and type of training	Noted in text above, members of the pollution prevention team are included in Table 25	Environmental Department, Human Resources Department	N/A
Train storm water team members	Noted in text above	Environmental Department	N/A
Prepare or acquire training manuals or training materials	Training materials are prepared	Environmental Department	N/A
Provide a training schedule	Storm Water Team training conducted around every June, BMP Training conducted initially and around every September of each year, and then as needed, New Team Member orientation conducted within first two weeks of employment, corrective action training conducted monthly at department meetings or as needed	Environmental Department	N/A
Maintain training documentation and the personnel that received the training	Trainings are documented	Environmental Department	N/A

6.1.7 Quality Assurance and Record Keeping

The SWPPP Manager is AJ Hezlep who reports to the Environmental Manager, Melisa Cohen, who reports directly to the General Manager of AB&I, Robin Henningsen, who has overall responsibility for the foundry and is the signatory for all storm water certifications and compliance verifications.
AB&I has developed and implemented management procedures to ensure that identified staff implements all elements of this SWPPP, including the Monitoring Implementation Plan. The BMP Inspection Form, which appears in Appendix B, is used to track and record outdoor industrial equipment and storage areas, outdoor industrial activities, and status and effectiveness of BMPs identified in this SWPPP. AB&I also uses internal software systems, Dakota Water and EHS Insight, to track these items.

Table 17: Quality Assurance and Record Keeping			
Quality Assurance and Record Keeping Minimum BMPs (section X.H.1 of IGP)	**Site Specific BMP Description**	**Person(s) Responsible**	**Actions performed in lieu of BMP**
Develop and implement management procedures to ensure implementation of MIP and all elements of SWPPP	SWPPP Team Training	Environmental Department	N/A
Develop a method of tracking and recording the implementation of BMPs identified in the SWPPP	Form ABI-EWI-006-01-F01: Monthly BMP Inspection Form ABI-EWI-007-01: Spill Kit Inspection Form ABI-EWI-008-01-F01: Hazardous Waste Storage Inspection Form ABI-EWI-008-01-F02: Containerized Waste Inspection Form ABI-EWI-094-05-F01: Sweeping Log Preventative Maintenance Program	All Departments	N/A
Maintain implementation records (i.e., BMP implementation records, employee training logs, spill occurrence and clean-up records)	BMP records such as spill and clean-up records are recorded in Dakota, preventative maintenance is recorded and tracked in ManagerPlus, and employee training records are recorded in PureSafety.	Environmental Department, Maintenance Department	N/A

6.2 Advanced BMPs

The AB&I facility has implemented advanced BMPs. These include the roof drainage systems, paved drainage surfaces, catch-basins and trench drains and sump pumps which are maintained by AB&I maintenance and environmental personnel. Storm Sump Diagrams are included in Appendix H.

6.2.1 Exposure Minimization BMPs

AB&I uses the following structural controls to minimize exposure:

- Additional roofing has been added to cover the core room, pipe finishing, molding, and grinding operations. Additionally, part of the Cupola area is covered.
- Large equipment and vehicle maintenance is done in a building or covered enclosure, except for contractor forklift maintenance.
- Spill Kits, indicated on the site map, are located near all bulk oil and fueling locations.
- Materials that may produce excess sediment in storm water run-off, such as waste sand, are stored under covered enclosures or are tarped during inclement weather.
- Structural control BMPs, specific to activities and potential pollutants, are listed in Table 19.

6.2.2 Storm Water Containment and Discharge Reduction BMPs

AB&I recycles storm water to be used as process cooling water when available. AB&I use the following storm water run-off reduction practices:

- Outfalls 1/7/8 Areas– Storm water is pumped from the sump into the stormwater collection tanks. An air diaphragm pump is used to pump stormwater from the collection tank directly into the process cooling water system to use as make-up water.
- Outfall 2 Area – Water accumulated in the sump can be pumped directly into the process cooling water system to use as make-up water.
- Outfall 3 Area – Water collected in the Outfall 3 sump can be pumped directly into the process cooling water system or stored in adjacent storage tanks to use as make-up water.

6.2.3 Treatment Control BMPs

AB&I calculated the flow needed to be treated using the maximum flow rate of runoff produced from a rainfall intensity of at least 0.2 inches per hour for each hour of a storm event. All storm water runoff that is generated at a rate equal to, or below 0.2 inches/hour falling in drainage areas serving Outfalls 1, 2, 3, 7, and 8 are pumped to the Stormwater Treatment System at Outfall 1.

The Storm Water Treatment System consists of three settling tanks (conical tank, flat-bottom tank, and Aquip tank) that are arranged in series to allow time for flocculent to react and the solids to settle. Two flocculent barrels are located adjacent to the conical tank and is injected into the first of the three tanks. Two electric process pumps pump liquids from the Aquip tank through 500 gallons per minute (gpm) Treatment Trains 1 and 2. A third pump is available if Pumps 1 or 2 fail. The first filtration unit in each treatment train is a sand filter that provides coarse mechanical filtration that removes particles larger than 75 - 100 microns in size. The second filtration unit for each treatment train is made up of an Orival Automatic Self-Cleaning Filter that removes particles larger than 35-55 microns. The last filtration unit in each treatment train is a media vessel with granular activated carbon that aide in the removal of organics. In addition, a 21,000-gallon tank is used by both train 1 and train 2 to process and store stormwater to be reused as process water for onsite production operations. After treatment, storm water is discharged at Outfall 1 to the City of Oakland storm sewer system.

The sumps at Outfalls 1, 2, and 3 will be inspected weekly by a member of the SWPPP Team, or designee. Maintenance or appropriate team members will be notified if maintenance or litter or debris removal is required. Department managers will be notified if additional sweeping, litter or debris removal associated with individual work stations is required.

Table 19 summarizes the potential pollutant sources and pollutants and the respective BMPs employed to minimize their impact on storm water quality.

Table 18: Advanced BMPs				
Advanced BMPs (Section X.H.2)	**Area(s) Implemented**	**Associated Industrial Activity / Material(s)**	**Inspection Frequency**	**Person(s) Responsible**
Exposure Minimization BMPs				
Additional roofing	Core room, pipe finishing, cast finishing, cupola	Molding and grinding operations	N/A	Maintenance Department
Large equipment and vehicle maintenance is done in a building or covered enclosure, except for contractor forklift maintenance	Rolling Stock	Fuel / Oils	N/A	Maintenance Department
Materials that may produce excess sediment in storm water run-off, such as waste sand, are stored under covered enclosures	Sand Storage Building	Waste Sand	N/A	Environmental Department
Storm Water Containment and Discharge Reduction BMPs				
Water pumped from Outfalls 1, 7, and 8 can be pumped into storm water storage tanks and can be pumped out directly into the process cooling water system and used as make-up water	Storm Water Treatment System Storage Tanks (Outfalls 1, 7, and 8 area)	Storm Water	Weekly	Environmental Department
Water accumulated in the sump can be pumped directly into the process cooling water system and used as make-up water	Outfall 2 Sump	Storm Water	Weekly	Environmental Department
Water collected in the sump can be pumped directly into the process cooling water system or stored in adjacent storage tanks	Outfall 3 Sump	Storm Water	Weekly	Environmental Department
Treatment Control BMPs				
Storm Water Treatment System	Foundry-wide	All	Prior to use	Environmental Department
Other Advanced BMPs				
Boom around drain	Outfalls 7 and 8	Metals / Sediment / Oils / Debris	Monthly	Environmental Department
Steel mesh screen located at sump overflow to catch floating debris prior to outfall into the storm sewer	Outfalls 1 and 2 Sumps	Floating debris	Weekly	Environmental Department
Second chamber outlet located after an inverted elbow	Outfalls 1, 2, and 3 Sumps	Floating oil	Weekly	Environmental Department

Sweeping

Locations
Sweeping is performed by Team Members to control dust generated by material handling activities or other particulate matter that may accumulate in exposed source areas. Other than general particulate matter that accumulates at source areas, the main sources of dust from material handling derives from metal melting operations, sand handling and molding processes, metal finishing and grinding, sand reclamation, cutoff, slag waste handling and welding operations. Particulate matter from these operations gets tracked through the general facility areas via forklift and foot traffic in and out of and between the buildings. The locations where dust may accumulate are the shipping and receiving areas, material handling areas, the Sand Reclamation/Sand Storage, the trash dumpster, the forklift maintenance area, and general traffic areas.

Frequency
Sweeping is conducted on a routine basis and is recorded in a weekly sweeping log (ABI-EWI-094-05-F01).

Personnel
Team Members from each department conduct sweeping at work stations and ancillary areas associated with their operations including the building interiors. Department supervisors are responsible to ensure that department personnel conduct sweeping as required. The sweeper operator will also conduct hand-sweeping in areas inaccessible to the riding sweeper.

Equipment
All hand-sweeping will be conducted with common push brooms or barn brooms. The facility operates an industrial riding vacuum sweeper which is operated on a routine basis and is responsible for sweeping general facility paved areas. Sweeping logs are completed by the sweeper operator and maintained by the Environmental Department. The diesel sweeper is maintained regularly and in the event of a major breakdown a rush will be performed on the repair or a rental unit will be used.

Water Spray
Dust from Cupola Charging, Mixing Waste Sand, and the Baghouse 1-5 Dust Bin are controlled by adding water to the material either by mixing or by water sprays.

Location
Cupola Charging is located at the Cupola, Mixing Waste Sand is in the Sand Storage Building, and the Baghouse 1-5 Dust Bin is located at Baghouse 1-5.

Frequency
Water sprays are operated as needed.

Personnel
The water sprays at the Cupola Charging area are maintained by the Cupola Department. The water sprays at Baghouse 1-5 and mixing sand with water in the Sand Storage Building is maintained by the Environmental Department.

Equipment and Tools
Water sprays are purchased and replaced from vendors as needed. Waste Sand Mixing is completed with a pay loader.

Routine Inspections

Inspections are conducted by the Environmental Department for the following potential pollutant source or activity: Emulsified Asphalt, Hot Asphalt Tanker Unloading, Diesel Fueling and Storage, New and Used Oil Storage and Dispensing, Gasoline Fueling, Flammable Waste Storage, Compressor Blowdown, Fume Baghouse Dust, Cupola Baghouse Dust, Forklift Maintenance, Mobile Equipment Maintenance, Air Compressors, Hot Dip Heating Oil, and Mist-Collector Condensate. All inspection records are maintained by the Environmental Department.

Location
Refer to Table 19 and the corresponding Site Map (Figure 5) for Map ID numbers and the location of each potential pollutant source on the site map.

Frequency
Inspections are conducted on a daily, weekly, or monthly basis.

Personnel
Inspections are conducted by the Environmental Department.

Equipment and Tools
Inspection forms are completed during each inspection.

Structural Overhead Coverage

Structural overhead coverage in the form of building overhangs, overhead coverage provided by ancillary roofed structures or overhangs mounted on building walls are provided for equipment or processes or activities that are located or conducted outdoors. Equipment is fully covered by the structural overhead coverage and process or activities are contained within the limits of the structural overhead coverage. The structural integrity of the coverage is maintained by the maintenance department or contracted services. The equipment or process activities which are structurally covered are as follows:

Machine Shop Filings – filings are deposited into drums and stored inside the Special Finishing Building.

Sand Storage Area – overhead coverage for truck loading, used cores disposal, slag, and waste sand.

Air Compressors – overhead coverage specifically made for the six air compressor units near the main building.

Material Storage – extended roof covering industrial materials (bentonite, graphite, clay, etc.).

Containment Berms

Area where containment berms are used to store large piles of material in an organized manner are used throughout the plant. While these concrete berms are not waterproof, they assist by controlling direction of stormwater flow from both sides of the berms.

Used for storage of limestone, charge handling material, scrap, coke, foundry returns, and inside waste storage building.

Secondary Containment and Flammable Storage Cabinets

The two 1,000-gallon diesel tanks are equipped with a ConVault double-contained storage tank and the Used Oil containers are double-walled. The Ink and Cleaner for Pipe Stenciling, the Gasoline, and the Flammable Waste are all stored within flammable storage cabinets. This BMP is implemented in conjunction with the use of absorbents and sweeping and drip pans. Team Members are trained to observe and comply with the use of drip pans and use of absorbents to clean up incidental spills and drips when dispensing liquids for use.

Absorbent Socks or Mats / Drip Pans

This includes the use of absorbent socks around the base of the air compressors, hydraulic or cooling equipment to contain any potential leaks or discharges of oil or oily water condensate. These items will be placed by maintenance staff and replaced as necessary based on weekly inspections and operational experience. Spent socks or mats will be stored in drums in the hazardous waste storage room and labeled as a hazardous waste.

Drip pans will be used by maintenance team members when performing maintenance activities outside that involve the draining or changing of fluids. Drip pans or pads will also be used in the Oil Room when dispensing liquids from the drums stored vertically with hand pumps. The liquids shall then be transferred to containers, stored and managed in accordance with applicable hazardous waste management regulations.

Stormwater Treatment Unit

The Stormwater Treatment Unit as described in Section 6.2.3 is located at the Western portion of the facility. The Stormwater Treatment Unit is equipped with sand filters, self-cleaning filters, and carbon media to filter out pollutants prior to being discharged offsite from Outfall 1 to the City of Oakland municipal storm sewer system. The full Operations & Maintenance Manual is in the environmental department.

Table 19: Summary of Potential Pollutant Sources, Pollutants and BMPs

TABLE 19 - POTENTIAL POLLUTANT SOURCES

MAP ID	Material / Activity	Location	Quantity	Potential Pollutant				Characteristic			BMPs					Affected Outfalls				
				Metals	TSS	Oil/Grease	pH	Liquid	Powder/ Dust	Solid	Inspections	Containment	Sweeping	Covered	Other	Outfall #1	Outfall #2	Outfall #3	Outfall #7	Outfall #8

7. Monitoring Implementation Plan

Storm water monitoring and reporting requirements were adopted by the SWRCB on April 1, 2014. This monitoring implementation plan (MIP) includes monthly visual observations, sampling event visual observations, storm water sampling and analysis, annual comprehensive facility compliance evaluation and an annual report. AB&I is a member in good standing of the Metal Industry Storm Water Group, Inc. (MISWG).

7.1 Monitoring

7.1.1 Monthly Non-Stormwater Discharge Visual Observations

The General Permit requires facility operators to perform visual observations of all industrial area drainage discharge points (Outfalls 1, 2, 3, 7, 8) within their facilities to evaluate them for the presence or indications of prior, current, or potential unauthorized non-storm water discharges and their sources. In addition, the monthly observations will include authorized NSWDs, sources, and associated BMPs to ensure that AB&I is reducing or preventing the contact of authorized NSWDs with materials or equipment that are potential pollutant sources, reduce the flow or volume of authorized NSWD, ensure that authorized NSWDs do not contain quantities of pollutants that cause or contribute to an exceedance of a water quality standard, reduces or prevents discharges of pollutants in authorized NSWDs in manner that reflects best industry practices. Finally, the monthly observations will include outdoor industrial equipment and storage areas, outdoor industrial activity areas, BMPs and all other potential sources of industrial pollutants. Visual observations will be conducted on a monthly basis during the reporting year, will be conducted during daylight hours, and on days without precipitation. Records shall be maintained of the visual observation dates, person making the observations, locations observed, presence and probable source of any observed pollutants, and any response actions and/or additional SWPPP revisions necessary in response to the visual observations. Blank Forms of the Monthly Visual Observations are included as Forms ABI-EWI-006-01-F01 and ABI-EWI-006-01-F02 in Appendix B.

The Annual Report will contain explanations for uncompleted monthly visual observations.

7.1.2 Storm Water Event Visual Observations

The General Permit requires facility operators to perform visual observations of storm water discharge points (Outfalls 1, 2, 3, 7, 8) from each storm water sampling event. Visual observations will be performed at the discharge locations during the time the discharge is sampled. A qualifying storm event is one that produces discharge for at least one drainage area and is preceded by at least 48 hours with no discharge from any drainage location and occurs during normally facility operating hours.

Samples from each discharge location will be collected within 4 hours of 1) the start of the discharge, or 2) the start of facility operations if the QSE occurs within the previous 12 hour period. Due to its flow-based treatment BMPs, AB&I shall sample any bypass that occurs while the visual observations and sampling of storm water discharge are conducted. Observations will be made for the presence of floating and suspended materials, oil and grease, discoloration, turbidity, odor,

trash/debris, any other notable characteristics and the source of any discharged pollutants. Blank forms for Storm Water Event Visual Observations are included as Form ABI-EWI-006-01-F03 in Appendix B.

The Environmental department shall maintain records of all storm water visual observations, including the team member performing the observations, observation dates, locations observed, approximate time, presence and possible source of any observed pollutants and corrective actions taken in response to observations.

In the event that a discharge location is not visually observed during the sampling event, AB&I will record which discharge locations were not observed during sampling or that there was no discharge from the discharge location. AB&I will provide an explanation in the Annual Report for uncompleted sampling event visual observations. This SWPPP will be revised as necessary to improve storm water management on the site as need be, based on the monitoring observations, including additional BMPs, enhancement of existing BMPs or to account for operating changes or changes in site configuration.

The visual assessment findings are documented on form ABI-EWI-006-01-F03 to meet the requirements of the monthly visual (SWRCB) permit required observations.

7.2 Sampling and Analysis

The sampling program required for the AB&I facility outlines the sampling frequency, sampling types and parameters, and sampling locations.

The Outfall 1 discharge point is representative of runoff from the sand, coke, and limestone storage areas, as well as part of the scrap storage area. The Outfall 2 discharge point is representative of the Cupola, and the bulk of foundry operations. The Outfall 3 discharge point is representative of shipping and the process water treatment area. The Outfall 7 and 8 discharge point is representative of runoff from the 77th Avenue fitting supply area. The Team Member parking lot is not used as an industrial area and is separated with concrete berms and therefore exempt from sampling requirements. Refer to Figure 4 – Site Drainage Map for further detail.

In 2014, AB&I modified the plumbing in drainage areas serving Outfall 1, Outfall 2, Outfall 3, and Outfalls 7 and 8 to combine all runoff generated from storm water falling in those drainage areas at a rate equal to, or below 0.2 inches/hour to Outfall 1 to the Stormwater Treatment System.

Grab samples of treated and discharged storm water up to 0.2 inches/hour will be collected at Outfall 1 at the treatment system sampling port. Since AB&I employs flow-based treatment BMP's, samples will be collected at the sumps for Outfalls 1, 2, 3, 7, and 8 if bypass or overflow conditions occur when sampling of treated stormwater AND visual observations are conducted. Refer to Table 20 below for further detail.

The facility conducted a pollutant source assessment of the HUC-10 – TMDL/303(d) listings. Based on its pollutant source assessment of the HUC -10 – TMDL/303(d) listings, the following impairments are NOT associated with facility industrial activities: Diazinon, Dieldrin, Dioxin compounds, Organic Enrichment/Low Dissolved Oxygen, Furan Compounds, PCB's (dioxin-

like), PCB's, DDT, and Chlordane.

Mercury [303(d)], Selenium [303(d)], Arsenic, Cadmium and Nickel were sampled and analysis showed that these parameters are below detection limits at the facility; therefore they will no longer be included in the sampling and analysis suite.

AB&I previously operated a non-ferrous metals recycling center, which required Lead (Pb) and Chemical Oxygen Demand (COD) to be added to the sampling and analysis suite. Due to closure of the non-ferrous metals recycling center operation, and removal of related industrial materials and practices, AB&I no longer analyzes Lead (Pb) and Chemical Oxygen Demand (COD).

AB&I has reviewed the TMDLs for its receiving waters and has found no additional requirements.

Table 20: Sampling Location and Description

Sample Location	Description
Outfall 1 (treated water outfall and potential bypass water outfall)	Sample collected from sampling port after storm water flows through SW Treatment System. If excess water above design flow of 0.2 inches/hour occurs directly out of the Outfall 1 sump and through the collection screen, a representative sample of this bypass will be collected at this location to coincide with required outfall sampling events, and noted on the sampling documents.
Outfall 2 (potential bypass water outfall)	Water collected in this sump can be recycled as process cooling water during production hours if needed, and any excess water will be pumped over to the SW Treatment System at Outfall 1. If excess water above design flow of 0.2 inches/hour occurs directly out of the Outfall 2 sump and through the collection screen, a representative sample of this bypass will be collected at this location to coincide with required outfall sampling events, and noted on the sampling documents
Outfall 3 (potential bypass water outfall)	Water collected in this sump will be recycled as process cooling water, and any excess water will be pumped over to the SW Treatment System at Outfall 1. If excess water above design flow of 0.2 inches/hour occurs directly out of the Outfall 3 sump and through the collection screen, a representative sample of this bypass will be collected at this location to coincide with required outfall sampling events, and noted on the sampling documents
Outfall 4:	Sample not collected – Non-Industrial team member parking area separated from Industrial activity with concrete berms, with storm drainage not combined with industrial storm water, and discharged to San Leandro Street, thence to 77th Avenue municipal system.
Outfall 7 (potential bypass water outfall)	Water collected in this drain is pumped over to the SW Treatment System at Outfall 1, up to design flow of 0.2 inches/hour. If excess water above design flow of 0.2 inches/hour occurs directly out of the Outfall 7 sump and through the collection screen, a representative sample of this bypass will be collected at this location to coincide with required outfall sampling events, and noted on the sampling documents
Outfall 8 (potential bypass water outfall)	Water collected in this drain is pumped over to the SW Treatment System at Outfall 1, up to design flow of 0.2 inches/hour. If excess water above design flow of 0.2 inches/hour occurs directly out of the

	Outfall 8 sump and through the collection screen, a representative sample of this bypass will be collected at this location to coincide with required outfall sampling events, and noted on the sampling documents

AB&I will collect, preserve and handle all storm water samples in accordance with Appendix C of this SWPPP. All sampling and sample preservation will be performed in accordance with the U.S. EPA's "Industrial Stormwater Monitoring and Sampling Guide," dated March 2009, and the "NPDES Storm Water Sampling Guidance Document," dated July 1992.

The mouth of the bottle will be pushed directly under the water flow until the bottle is nearly full. Before the bottle completely fills, it will be removed from the flow and capped. Samples are collected in accordance with the sampling instructions included in Appendix C of this plan, including instructions for sample handling and labeling and for completing the chain-of-custody forms. All analysis shall be conducted at a laboratory certified for such analysis by the State Department of Health Services (California-certified laboratory).

The storm water monitoring, sampling, and analysis program is summarized below:

Table 21: MISWG Monitoring Schedule

California Rain Season	Description
July 1 to December 31	Sample from treated discharge (Outfall 1) and, each bypass discharge location (Outfall 1, Outfall 2, Outfall 3, Outfall 7 and Outfall 8) for 1 QSE during the same sampling event ONLY if bypass occurs on that discharge sampling event.
January 1 to June 30	Sample from treated discharge (Outfall 1) and, each bypass discharge location (Outfall 1, Outfall 2, Outfall 3, Outfall 7 and Outfall 8) for 1 QSE during the same sampling event ONLY if bypass occurs on that discharge sampling event.

NOTE: If facility samples more frequently than required, the results will be included in the calculation and reporting of the data submitted.

Table 22: Sampling Frequency

Sampling Location	IGP (Group Monitoring)
Outfall 1 (treated water outfall)	One QSE sample within the first half of each reporting year (July-Dec) and one QSE sample within the second half of the reporting year(Jan-June)
Outfall 1 (bypass) Outfall 2 (bypass) Outfall 3 (bypass) Outfall 7 (bypass) Outfall 8 (bypass)	Sampled during any bypass that occurs while the visual observations and sampling of treated stormwater discharge are conducted.

Notes:
1. The facility will sample pursuant to IGP requirements.
2. IGP samples are collected during a Qualified Storm Event (QSE)

Table 23: Sample Analysis			
Parameter	**Analysis / Method**	**Annual NAL**	**Instantaneous Maximum NAL**
Total Suspended Solids (TSS)	TSS (Glass Fiber) / SM 2540D	100 mg/L	400 mg/L
Aluminum (Al)	Total / EPA 200.8	0.75 mg/L	N/A
Copper (Cu)	Total / EPA 200.8	0.0332 mg/L	N/A
Iron (Fe)	Total / EPA 200.7	1.0 mg/L	N/A
Zinc (Zn)	Total / EPA 200.8	0.26 mg/L	N/A
pH	pH / SM 4500HB	N/A	6.0 - 9.0
Oil and Grease (O&G)	EPA 1664A	15 mg/L	25 mg/L
Magnesium (Mg)	Total / EPA 200.7	0.064 mg/L	N/A

SM = Standard Methods for the Examination of Water and Wastewater from American Public Health Association
N/A = Not Applicable

Table 24: Sample Containers			
Parameter	**Container**		**Preservative**
	Type	***Size***	
Total Suspended Solids (TSS) pH	Plastic	500 mL	None
Metals	Plastic	1,000 mL	1 mL – Nitric Acid
Oil and Grease (O&G)	Amber glass	1,000 mL	1 mL HCl

7.3 Annual Comprehensive Facility Compliance Evaluation (Annual Evaluation)

The Environmental Manager or her designee will conduct an annual comprehensive facility compliance evaluation (ACFCE) for each reporting year (July 1 through June 30). If AB&I conducts an Annual Evaluation fewer than eight (8) months, or more than sixteen (16) months, after it conducts the previous Annual Evaluation, AB&I will document the justification for doing so. AB&I will revise the SWPPP, as appropriate, and implement the revisions within 90 days of the Annual evaluation. The Annual Evaluation will include:

- A review of all sampling, visual observation, and inspection records conducted during the previous reporting year.
- An inspection of all areas of industrial activity and associated potential pollutant sources for evidence of, or the potential for, pollutants entering the storm water conveyance system.
- An inspection of all drainage areas previously identified as having no exposure to industrial activities in accordance with the following requirements:
    - Discharges composed entirely of storm water that has not been exposed to industrial activity are not industrial storm water discharges. Dischargers are conditionally excluded from complying with the SWPPP and monitoring requirements of this General Permit if all of the following conditions are met:
        - There is no exposure of Industrial Materials and Activities to rain, snow, snowmelt, and/or runoff;

    - All unauthorized NSWDs have been eliminated and all authorized NSWDs meet the conditions of Section IV;
    - The Discharger has certified and submitted via SMARTS PRDs for NEC coverage pursuant to the instructions in Section II.B.2; and,
    - The Discharger has satisfied all other requirements of this Section.
- An inspection of the equipment needed to implement the BMPs.
- An inspection of any BMPs.
- A review and evaluation of all BMPs (both structural and non-structural) for each area of industrial activity and associated potential pollutant sources.
- A review and effectiveness assessment of all BMPs for each area of industrial activity and associated potential pollutant sources to determine if the BMPs are properly designed, implemented, and are effective in reducing and preventing pollutants in industrial storm water discharges and authorized NSWDs.
- An assessment of any other factors needed to comply with the requirements for the Annual Report.

An example of this Annual Evaluation report appears in Appendix B.

7.4 Annual Report

The Annual Report must be certified and submitted via SMARTS no later than July 15th following each reporting year using the standardized format and checklists in SMARTS.

The report will include:

- A Compliance Checklist that indicates whether a Discharger complies with, and has addressed all applicable requirements of the General Permit;
- An explanation for any non-compliance of requirements within the reporting year, as indicated in the Compliance Checklist;
- An identification, including page numbers and/or sections, or all revisions made to the SWPPP within the reporting year; and
- The date(s) of the Annual Evaluation.

The report will be signed and certified in accordance with the standard provisions of the General Permit. The annual report questionnaire and attached forms must be obtained on-line by down loading them from http://www.swrcb.ca.gov/water_issues/programs/stormwater/annualreport.shtml or by written request to the SWRCB.

7.5 Record Keeping and Sample Analysis Reporting

AB&I will submit all sampling and analytical results for all individual or Qualified Combined Samples via SMARTS within 30 days of obtaining all results for each sampling event.

AB&I will provide the method detection limit when an analytical result from samples taken is reported by the laboratory as a “non-detect” or less than the method detection limit. A value of zero will not be reported.

AB&I will provide the analytical result from samples taken that is reported by the laboratory as below the minimum level (often referred to as the reporting limit) but above the method detection limit.

Reported analytical results will be averaged automatically by SMARTS. For any calculations required by the General Permit, SMARTS will assign a value of zero (0) for all results less than the minimum level as reported by the laboratory.

- At the beginning of a Discharger's NOI Coverage, all Dischargers have Baseline status for all parameters.
- A Discharger's Baseline status for any given parameter shall change to Level 1 status if sampling results indicate an NAL exceedance for that same parameter. Level 1 status will commence on July 1 following the reporting year during which the exceedance(s) occurred.
- A Discharger's Level 1 status for any given parameter shall change to Level 2 status if sampling results indicate an NAL exceedance for that same parameter while the Discharger is in Level 1. Level 2 status will commence on July 1 following the reporting year during which the NAL exceedance(s) occurred.

Records of all storm water discharge compliance documentation including either paper or electronic copies of all reports required by this SWPPP or the General Permit must be retained for a period of at least five years. Copies are available for review by the Water Board's staff at the facility during scheduled operating hours. These records include:

- Copies of BMP implementation records and records related to any spills and cleanup related response activities;
- Copies of Annual Reports including sampling and analysis results, observation documentation, ACFCE report, summaries of corrective actions and SWPPP revisions and explanations of incidents of noncompliance;
- Storm water sampling records including the name of the sampler, sample dates and times, exact locations, observations, dates and times of laboratory analysis, individuals who performed the analysis, analytical methods and results, and QA/QC results;
- Records of visual observations
- Inspection Logs;
- Team Member Training Records;
- Level 1 ERA Evaluation and Report, if applicable
- Level 2 Action Plan and Demonstration Report, if applicable

8. Pollution Prevention Team

The General Permit requires that each SWPPP identify a specific individual or individuals within the organization as members of the Storm Water Pollution Prevention Team. The SWPPP must identify specific individuals by name and position. The plan must define each team member's role and responsibility with respect to developing the SWPPP, assisting the facility manager in SWPPP implementation and revision, and conducting all monitoring program activities. Naming the individual Team Members makes it clear that part of each person's job is to prevent storm water pollution. Identifying a specific individual also provides a point of contact for those outside of the facility (e.g., regulatory officials) that may need to review or discuss aspects of the facility's SWPPP.

Effective organization is important for the team to be able to accomplish the task of implementing and maintaining a comprehensive SWPPP. There are two important features in organizing a team of this nature: selecting the right individuals to serve on the team; and establishing good channels of communication. The Team is responsible for development and implementation of storm water management controls to minimize the discharge of pollutants to the environment. The Team has the overall responsibility for the program and instituting revisions whenever necessary and for overseeing all aspects of the SWPPP. Records will be kept at the office of the Team Leader.

The Team's responsibilities include initial site assessment, identification of pollutant sources and risks, decision making on appropriate Best Management Practices (BMPs), directing the actual implementation of the BMPs, and regular evaluations to measure the effectiveness of the SWPPP. To ensure that the SWPPP remains effective, the person or Team responsible for maintaining the Plan must be aware of any changes that are made in plant operations to assess the nature of those revisions.

While a designated individual or Team can be assigned the job of developing and implementing this SWPPP, the plant management is ultimately responsible for the implementation of the SWPPP and for compliance with all applicable storm water requirements. Accordingly, the designated individual or Team must have a clear line of communication with plant management to ensure that they are able to function in a cooperative partnership.

Team members will be specified to assist the Team Leader during inspections and to ensure that corrective actions are carried out, as necessary. The Team Leader is the designated contact person with respect to communication with entities outside of the facility, including regulatory agencies. Facility staff shall be instructed to refer regulatory agency inspectors or other authorities to the Team Leader and the Team leader shall accompany them during tours of the facility and grounds during inspections. In the event the Team Leader is not present, an alternative contact person who is knowledgeable about the SWPPP, implementation of BMPs and the location of all compliance documentation records shall be designated. Alternate contact persons should also be designated for times when the Team Leader is routinely not expected to be present. All Team members will be familiar with the SWPPP, adequately trained in its intentions, and committed to implementing storm water management controls outlined in the SWPPP. A list of current Team Members anticipated to implement and maintain adequate storm water management practices is presented in the table below.

Table 25: Storm Water Pollution Prevention Team Roster			
Team Member	**Title**	**Department**	**Individual Responsibilities**
Melisa Cohen	Environmental Manager	Environmental	Managing all environmental operations
Dale Darling	Plant Manager	Plant	Alternate Contact Person/Maintenance of control measures/BMP Implementation
Rich Watson	Plant VP Operations	Plant	Engineering
Billy Ngiraikelau	Maintenance Manager	Environmental	Maintenance of Control Measures/BMP Implementation
Mark Hoag	Maintenance Operator	Environmental	BMP Implementation
Robin Henningsen	General Manager	All	Legally Responsible Person
AJ Hezlep	Environmental Specialist	Environmental	SWPPP Manager/SWPPP training/ Inspections/ Sampling/Supervising Corrective Actions and BMPs

All public inquiries and regulatory personnel will be referred to the Team Leader or the Alternate Contact Person. During second or third shift operations or during weekends, the primary or alternate contact person will be contacted by cell phone. Security guards and reception personnel will be so instructed.

In the event that the team leader will not be available to conduct required monitoring or sampling activities, he shall identify alternate individuals to do so. These activities include non-storm water visual observations and quarterly inspections, storm water visual observations, storm water sampling and analysis and /or annual comprehensive site compliance evaluations. Persons so designated shall have received the general training and training specific with respect to each assigned task. The Team Leader shall notify the plant manager when these tasks are delegated to alternate individuals.

APPENDIX A

Storm Water General Permit Compliance Check List

Form 4: ABI-EWI-006-01-F11 (Annual Comprehensive Facility Compliance Evaluation)

A. General Information			
Facility Name	ABI Foundry		
NPDES Tracking No.	WDID # 2 01I002972		
Physical Address	7825 San Leandro Street		
	Oakland	CA	94621
Date of Inspection [Section XVI.B.4]		**Start/End Time**	
Inspector's Name & Title			

B. General Inspection Findings

1. Did you review all sampling, visual observation, and inspection records conducted during the previous reporting year? [Section XV.A]

☐Yes If YES, summarize results

☐No If NO, describe why not:

2. Did you conduct an inspection of all areas of industrial activity and associated potential pollutant sources for evidence of, or the potential for, pollutants entering the storm water conveyance system? Refer to Table 19 of the SWPPP if needed. [Section XV.B]

☐Yes
☐No If NO, describe why not:

3. Did you conduct an inspection of all drainage areas previously identified as having no exposure to industrial areas and materials in accordance with the definitions in Section XVII? [Section XV.C]

☐N/A No areas with "no exposure", go to Section 4.
☐Yes Complete section 3.a
☐No If NO, describe why not:

3.a No Exposure Checklist – NONE of the following materials or activities are, or will be in the foreseeable future, exposed to precipitation, and all NSWD have been eliminated: [Appendix 2.D]

- ❑ Using, storing or cleaning industrial machinery or equipment, and areas where residuals remain and are exposed
- ❑ Materials or residuals on the ground or in storm water inlets from spills/leaks
- ❑ Materials or products from past industrial activity
- ❑ Material handling equipment
- ❑ Materials or products during loading/unloading or transporting activities
- ❑ Materials or products stored outdoors
- ❑ Materials contained in open, deteriorated or leaking storage drums, barrels, tanks, and similar containers
- ❑ Materials or products handled/stored on roads
- ❑ Waste material
- ❑ Application or disposal of processed wastewater
- ❑ Particulate matter or visible deposits of residuals from roof stacks/vents evident in the storm water outflow

3.b NEC Certification

"I certify under penalty of law that I have read and understand the eligibility requirements for drainage areas listed in the SWPPP for the facility; and that none of the industrial materials or activities listed in section XVII.C are, or will be in the foreseeable future, exposed to precipitation." [XVII.E.1]

Print name and title: _____

Signature:_____ **Date:**_____

4. Did you conduct an inspection of equipment needed to implement the BMPs? [Section XV.D]

Yes

No If NO, describe why not:

5. Did you conduct an inspection of structural and/or treatment control BMPs? [Section XV.E]

Yes

No If NO, describe why not:

6. Assess any other factors needed to complete the annual report. [Section XV.G]
   - ❑ Review of the Compliance checklist in SMARTS. [Section XVI.B.1]
   - ❑ Explanation of any non-compliance of requirements. [Section XVI.B.2]
   - ❑ Identification, including page numbers and/or sections, of all revisions made to the SWPPP within the reporting year. [Section XVI.B.3]

7. Review and assess all BMPs for each area of industrial activity and associated potential pollutant sources and record in part C of this form. [Section XV.F]

C. Industrial Activity Area Specific Findings

Complete one block for each industrial activity area where pollutants may be exposed to stormwater. Copy this section for additional industrial activity areas.

In reviewing each area, you should consider

- Industrial materials, residue, or trash that may have or could come in to contact with stormwater;
- Leaks or spills from industrial equipment, drums, tanks, and other containers;
- Offsite tracking of industrial or waste materials from areas of no exposure to exposed areas; and
- Tracking or blowing or raw, final, or waste materials from areas of no exposure to exposed areas.

Industrial Activity Area:

1. Brief Description:

2. Are any control measures in need of maintenance or repair? ☐Yes ☐No
3. Have any control measures failed and require replacement? ☐Yes ☐No
4. Are any additional/revised control measures necessary in this area? ☐Yes ☐No

If YES to any of these three questions, provide a description of the problem: (Any necessary corrective actions should be described on the attached Corrective Action Form)

Industrial Activity Area:

If YES to any of these three questions, provide a description of the problem: (Any necessary corrective actions should be described on the attached Corrective Action Form)

D. Corrective Actions

Complete this page for each specific condition requiring a corrective action or a review determining that no corrective action is needed. Copy this page for addition al corrective actions or reviews.

Include both corrective actions that have been initiated or completed since the last annual report, and future corrective actions needed to address problems identified in this comprehensive stormwater inspection.

1. Corrective Action # of for this reporting period.

2. Is this corrective action:
   - ❑ An update on a corrective action from a previous annual report; or
   - ❑ A new corrective action?

3. Identify the condition(s) triggering the need for this review:
   - ❑ Unauthorized release or discharge
   - ❑ Numeric effluent limitation exceedance
   - ❑ Control measure inadequate to meet applicable water quality standards
   - ❑ Control measure inadequate to non-numeric effluent limitations
   - ❑ Control measures not properly operated and maintained
   - ❑ Change in facility operations necessitated change in control measures
   - ❑ Average benchmark value exceedance
   - ❑ Other (describe):

4. Briefly describe the nature of the problem identified:

5. Date problem identified:
6. How problem was identified:
   - ❑ Comprehensive site inspection
   - ❑ Quarterly visual assessment
   - ❑ Routine facility inspection
   - ❑ Benchmark monitoring
   - ❑ Notification by EPA or State or local authorities
   - ❑ Other (describe):

7. Description of corrective action(s) taken or to be taken to eliminate or further investigate the problem (e.g. describe modifications or repairs to control measures, analyses to be conducted, etc.) or if no modifications are needed, basis for that determination:

8. Did/will this corrective action require modification of your SWPPP?

9. Date corrective action initiated:
10. Date corrective action completed:
11. If corrective action not yet completed, provide the status of corrective action at the time of the comprehensive site inspection and describe any remaining steps (including timeframes associated with each step) necessary to complete corrective action:

APPENDIX C

Storm Water Sampling Instructions

SAMPLE COLLECTION AND HANDLING INSTRUCTIONS

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) GENERAL PERMIT FOR STORM WATER DISCHARGES ASSOCIATED WITH INDUSTRIAL ACTIVITIES

(GENERAL PERMIT)

For more detailed guidance, Dischargers should refer to the U.S. EPA's "Industrial Stormwater Monitoring and Sampling Guide," dated March 2009, available at: http://www.epa.gov/npdes/pubs/msgp_monitoring_guide.pdf and the "NPDES Storm Water Sampling Guidance Document," dated July 1992, available at: http://www.epa.gov/npdes/pubs/owm0093.pdf .

1. Identify the sampling parameters required to be tested and the number of storm water discharge points that will be sampled. Request the analytical testing laboratory to provide the appropriate number and type of sample containers, sample container labels, blank chain of custody forms, and sample preservation instructions.
2. Determine how samples will be transported to the laboratory. The testing laboratory should receive samples within 48 hours of the physical sampling (unless otherwise required by the laboratory). The Discharger may either deliver the samples to the laboratory, arrange for the laboratory to pick up the samples, or overnight ship the samples to the laboratory. All sample analysis shall be done in accordance with 40 Code of Federal Regulations part 136. Samples for pH have a holding time of 15 minutes.[1]
3. Qualified Combined Samples shall be combined by the laboratory and not by the Discharger. Sample bottles must be appropriately labeled to instruct the laboratory on which samples to combine.
4. Unless the Discharger can provide flow weighted information, all combined samples shall be volume weighted.
5. For grab samples, use only the sample containers provided by the laboratory to collect and store samples. Use of any other type of containers may contaminate samples.
6. For automatic samplers that are not compatible with bottles provided by the laboratory, the Discharger is required to send the sample container included with the automatic sampler to the laboratory for analysis.

[1] 40 C.F.R. section 136.3, Table II - Required Containers, Preservation Techniques, and Holding Times.

7. The Discharger can only use automatic sampling device to sample parameters that the device is designed to. For pH, Dischargers can only use automatic sampling devices with the ability to read pH within 15 minutes of sample collection.
8. The Discharger is prohibited from using an automatic sampling device for Oil and Grease, unless the automatic sampling device is specifically designed to sample for Oil and Grease.
9. To prevent contamination, do not touch inside of sample container or cap or put anything into the sample containers before collecting storm water samples.
10. Do not overfill sample containers. Overfilling can change the analytical results.
11. Tightly screw on the cap of each sample container without stripping the threads of the cap.
12. Complete and attach a label for each sample container. The label shall identify the date and time of sample collection, the person taking the sample, and the sample collection location or discharge point. The label should also identify any sample containers that have been preserved.
13. Carefully pack sample containers into an ice chest or refrigerator to prevent breakage and maintain temperature during shipment. Remember to place frozen ice packs into shipping containers. Samples should be kept as close to 4 degrees Celsius (39 degrees Fahrenheit) as possible until arriving to the laboratory. Do not freeze samples.
14. Complete a Chain of Custody form for each set of samples. The Chain of Custody form shall include the Discharger's name, address, and phone number, identification of each sample container and sample collection point, person collecting the samples, the date and time each sample container was filled, and the analysis that is required for each sample container.
15. Upon shipping/delivering the sample containers, obtain both the signatures of the persons relinquishing and receiving the sample containers.
16. Dischargers shall designate and train personnel to collect, maintain, and ship samples in accordance with the sample protocols and laboratory practices.
17. Refer to Table 1 in the General Permit for test methods, detection limits, and reporting units.
18. All sampling and sample preservation shall be in accordance with 40 Code of

Federal Regulations part 136 and the current edition of "Standard Methods for the Examination of Water and Wastewater" (American Public Health Association). All monitoring instruments and equipment (including Discharger field instruments for measuring pH or specific conductance if identified as an additional sampling parameter) shall be calibrated and maintained in accordance with manufacturers' specifications to ensure accurate measurements. All laboratory analyses shall be conducted according to approved test procedures under 40 Code of Federal Regulations part 136, unless other test procedures have been specified by the Regional Water Quality Control Board. All metals shall be reported as total metals. Dischargers may conduct their own field analysis of pH (or specific conductance if identified as an additional sampling

parameter) if the Discharger has sufficient capability (qualified and trained Team Members, properly calibrated and maintained field instruments, etc.) to adequately perform the field analysis. With the exception of field analysis conducted by Dischargers for pH (or specific conductance if identified as an additional sampling parameter), all analyses shall be sent to and conducted at a laboratory certified for such analyses by the California Department of Public Health. Dischargers are required to report to the Water Board any sampling data collected more frequently than required in this General Permit (Section XXI.J.2)

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Haley & Aldrich, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Haley & Aldrich, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2017. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

EDR Property Tax Map Report

Environmental Data Resources, Inc.'s EDR Property Tax Map Report is designed to assist environmental professionals in evaluating potential environmental conditions on a target property by understanding property boundaries and other characteristics. The report includes a search of available property tax maps, which include information on boundaries for the target property and neighboring properties, addresses, parcel identification numbers, as well as other data typically used in property location and identification.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527-21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

EXECUTIVE SUMMARY

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal sites subject to CERCLA removals and CERCLA orders

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 10/20/2021 has revealed that there are 4 SEMS sites within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 10/20/2021 has revealed that there are 9 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Lists of Federal RCRA facilities undergoing Corrective Action

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 09/13/2021 has revealed that there are 2

CORRACTS sites within approximately 1 mile of the target property.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 09/13/2021 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

Lists of Federal RCRA generators

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 09/13/2021 has revealed that there are 8 RCRA-LQG sites within approximately 0.25 miles of the target property.

Lists of state- and tribal (Superfund) equivalent sites

RESPONSE: Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

A review of the RESPONSE list, as provided by EDR, has revealed that there are 5 RESPONSE sites within approximately 1 mile of the target property.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State

Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 10/25/2021 has revealed that there are 26 ENVIROSTOR sites within approximately 1 mile of the target property.

Lists of state and tribal landfills and solid waste disposal facilities

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the SWF/LF list, as provided by EDR, has revealed that there are 2 SWF/LF sites within approximately 0.5 miles of the target property.

CPS-SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CPS-SLIC list, as provided by EDR, has revealed that there are 22 CPS-SLIC sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Alameda County CS: A listing of contaminated sites overseen by the Toxic Release Program (oil and groundwater contamination from chemical releases and spills) and the Leaking Underground Storage Tank Program (soil and ground water contamination from leaking petroleum USTs).

A review of the Alameda County CS list, as provided by EDR, and dated 01/09/2019 has revealed that there are 49 Alameda County CS sites within approximately 0.5 miles of the target property.

Lists of state and tribal registered storage tanks

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 4 UST sites within approximately 0.25 miles of the target property.

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 17 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 09/13/2021 has revealed that there are 28 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

FUDS: The Listing includes locations of Formerly Used Defense Sites Properties where the US Army Corps Of Engineers is actively working or will take necessary cleanup actions.

A review of the FUDS list, as provided by EDR, and dated 08/10/2021 has revealed that there is 1 FUDS site within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
OAKLAND MUNICIPAL AI		SSE 1/2 - 1 (0.832 mi.)	AT249	1467

2020 COR ACTION: The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

A review of the 2020 COR ACTION list, as provided by EDR, and dated 09/30/2017 has revealed that there is 1 2020 COR ACTION site within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past

sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 2 EDR Hist Auto sites within approximately 0.125 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
GRAYS CHEVRON SERVIC	7617 SAN LEANDRO	0 - 1/8 (0.000 mi.)	B27	250
G & Z INC	8255 SAN LEANDRO ST	ESE 0 - 1/8 (0.029 mi.)	C40	308

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there is 1 EDR Hist Cleaner site within approximately 0.125 miles of the target property.

LUST:

Name:	AMERICAN BRASS & IRON FOUNDRY
Address:	7825 SAN LEANDRO
City,State,Zip:	OAKLAND, CA 94621
Lead Agency:	ALAMEDA COUNTY LOP
Case Type:	LUST Cleanup Site
Geo Track:	http://geotracker.waterboards.ca.gov/profile_report.asp?global_id=T0600100065
Global Id:	T0600100065
Latitude:	37.7500695816155
Longitude:	-122.193567752838
Status:	Completed - Case Closed
Status Date:	11/29/2011
Case Worker:	Not reported
RB Case Number:	01-0071
Local Agency:	Not reported
File Location:	All Files are on GeoTracker or in the Local Agency Database
Local Case Number:	RO0000092
Potential Media Affect:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	Gasoline
Site History:	AB&I has operated on the Site for approximately 77 years. Business activities include the manufacture of cast pipe and fittings. The facility accepts scrap iron and steel, which it stockpiles on-site, and uses during manufacturing activities. The Site encompasses an area of approximately 11.8 acres. The Site contains various warehouses, manufacturing and office buildings. The entire Site is covered with buildings and asphalt and concrete pavement. The Site is located in a heavy industrial area near the San Leandro Bay within an area identified as the East Bay Plain. Releases occurred from seven underground storage tanks (USTs) that were previously located on-site. The USTs included one 8,000-gallon UST used for storing unleaded gasoline and one 8,000-gallon UST used for the storage of mineral spirits and later 1,1,1-trichloroethane (1,1,1-TCA), one 550-gallon UST used for storing regular leaded gasoline, one 10,000-gallon UST used for storing diesel, and three 10,000-gallon USTs used for storing gasoline. Pilot studies were conducted to address a plume of chlorinated solvents in groundwater in one area of the site and a plume of petroleum hydrocarbons in another area of the site. The pilot studies consisted of an enhanced aerobic biodegradation study and an enhanced anaerobic biodegradation study. Groundwater monitoring indicated that the pilot studies were effective in reducing groundwater concentrations. The site was closed with a Covenant and Environmental Restriction on Property (deed

AMERICAN BRASS & IRON FOUNDRY (Continued) **S101624519**

restriction) that limits future land use to industrial. A Site Management Plan is also place to control potential future exposure to residual contamination. Please see the Covenant and Environmental Restriciton on Property and Site Management Plan for a description of the residual contamination and the restrictions on future property use.

AMERICAN BRASS & IRON FOUNDRY (Continued) **S101624519**

City,State,Zip:	OAKLAND, CA 94621
Region:	STATE
Facility Status:	**Completed - Case Closed**
Status Date:	09/13/2011
Global Id:	SL18298719
Lead Agency:	SAN FRANCISCO BAY RWQCB (REGION 2)
Lead Agency Case Number:	Not reported
Latitude:	37.751256
Longitude:	-122.193164
Case Type:	Cleanup Program Site
Case Worker:	UUU
Local Agency:	Not reported
RB Case Number:	SL18298719
File Location:	Regional Board
Potential Media Affected:	Surface water
Potential Contaminants of Concern:	Arsenic, Chromium, Copper, Lead, Other Metal
Site History:	American Iron & Brass, discharger, owned & operated a cast iron foundry for the manufacture of cast iron fittings and pipes at 7825 San Leandro Street in Oakland. The Regional Water Quality Control Board adopted Cleanup and Abatement Orders 95-149, 93-053, 88-090, and NPDES Permit CA 00227952. Pursuant to the NPDES permit, American Brass & Iron may discharge non-contact cooling water and stormwater to Elmhurst Creek, being Waters of the State. Pursuant to Prohibition A.2 of that Order, stormwater runoff which has been in contact with process wastes and raw materials, is prohibited from being discharged to Waters of the State. Cleanup and Abatement Orders were issued in response to discharges to Elmhurst Creek, possiby via on-site sotrm drains, contrary to prohibitions outlined in the permit. During an April 14, 1995 site inspection and again on May 3, 1995, Board staff observed a black powdery waste material throughout the site on the paved areas and outside of the facility. The black and gritty material was grab sampled, analyzed and determined to consist of lead, zinc, copper, chromium, and arsenic at concentrations that exceed the allowable levels. Deposits of the waste material were observed in Elmhurst Creek at the waste-water outfalll W0001, being similar to the material found on the paved areas of the discharger's facility. Details are presented in Cleanup and Abatement Order 95-149, in site documents, technical correspondence.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

CERS:
Name: ABI FOUNDRY
Address: 7825 SAN LEANDRO ST
City,State,Zip: OAKLAND, CA 94621
Site ID: 384130
CERS ID: 10238632
CERS Description: Chemical Storage Facilities

Violations:
Site ID: 384130
Site Name: ABI Foundry
Violation Date: 03-23-2016
Citation: 22 CCR 12 66262.40(c) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.40(c)
Violation Description: Failure to determine if the waste generated is a hazardous waste and to maintain analysis results for three years.
Violation Notes: Returned to compliance on 02/14/2017. OBSERVATION: Stormwater is exposed to facility processes/storage, collected and treated before discharge. Contact water from process (hot dip water spray, pipe slurr) is collected in contact water sump, treated and re-used in the process. Foundry generates slag which is disposed as solid waste. CORRECTIVE ACTION: Submit waste analysis for the collected stormwater and contact water before treatment, and the foundry slag waste for hazardous waste determination to CUPA within 30 days.
Violation Division: Alameda County Environmental Health
Violation Program: HWLQG
Violation Source: CERS,

Site ID: 384130
Site Name: ABI Foundry
Violation Date: 03-23-2016
Citation: HSC 6.95 25508.1(a)-(e) - California Health and Safety Code, Chapter 6.95, Section(s) 25508.1(a)-(e)
Violation Description: Failure to electronically update business plan within 30 days of any one of the following events: A 100 percent or more increase in the quantity of a previously disclosed material. Any handling of a previously undisclosed hazardous materials at or above reportable quantities. A change of business address, business ownership, or business name.
Violation Notes: Returned to compliance on 04/11/2016. OBSERVATION: The following hazardous materials were observed on site but were not in the facility's inventory. 1x1,000 gal diesel fuel (generator) Sea coal (shipping storage area) Reno Super Abrade (shipping storage area) CORRECTIVE ACTION: Complete the Hazardous Materials Inventory Chemical Description page for all chemicals above reporting threshold in the California Environmental Reporting System (CERS) within 30 days.

Citation: HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)
Violation Description: Failure to comply with all of the following requirements: 1. Failure to conduct inspections and tests in accordance with written procedures that you or a certifying engineer have developed for the facility. 2. Failure to sign written procedures and/or a record of inspections and/or customary business records by the appropriate supervisor or inspector. 3. Failure to keep written procedures and/or a record of inspections and/or customary business records with the plan. AND 4. Failure to maintain written procedures and/or a record of inspections and/or customary business records for three years.
Violation Notes: Returned to compliance on 04/29/2016. OBSERVATION: According to the facility, the secondary containment of the diesel tanks (ConVault 2x1,000 gal) is inspected by their contractor annually. The facility's SPCC plan states operating personnel inspects secondary containment of diesel tanks monthly. CORRECTIVE ACTION: Submit inspection logs of ConVault tanks to CUPA and update SPCC plan with correct information within 30 days.

Site Name:	ABI Foundry
Violation Date:	07-16-2009
Citation:	22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Description:	Failure to properly label hazardous waste accumulation containers with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.
Violation Notes:	Returned to compliance on 08/17/2009.
Violation Division:	Oakland City Fire Department
Violation Program:	HWLQG
Violation Source:	CERS,
Site ID:	384130
Site Name:	ABI Foundry
Violation Date:	06-24-2019
Citation:	22 CCR 15 66265.16 - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.16
Violation Description:	Failure to provide employees with hazardous waste training program of class room instructions or on-the-job training within the first six months after the date of their employment or assignment to a facility, or to a new position at a facility and annually thereafter. Training records on current personnel shall be kept until closure of the facility and for former employees the record shall be kept for at least three years from the date the employee last worked at the

AMERICAN BRASS & IRON FOUNDRY (Continued) **S101624519**

facility. The records shall include the following: the job title for each position at the facility related to hazardous waste management, and the name of the employee filling each job; a written job description for each position, duties of facility personnel assigned to each position, and a written description of the type and amount of both introductory and continuing training that will be given to each person filling a position.

Violation Notes: Returned to compliance on 08/09/2019. As demonstrated by the hazardous waste violations observed at the time of inspection, proper training documentation requirements has not been maintained. The records shall include the following: the job title for each position at the facility related to hazardous waste management, and the name of the employee filling each job; a written job description, duties of facility personnel assigned to each position and a written description of the type and amount of both introductory and continuing training that will be given to each person filing a position. Generator has training documentation, but it is missing the job titles, job description for each position, duties of facility personnel assigned to each position, and a written description of the type and amount of both introductory and continuing training that will be given to each person filing a position. Document training according to the requirements of 22 CCR 15 66265.16(d). Submit a copy of the documentation to the CUPA.

Name: ABI FOUNDRY
Address: 7825 SAN LEANDRO ST
City,State,Zip: OAKLAND, CA 94621
Site ID: 384130
CERS ID: 205470
CERS Description: Industrial Facility Storm Water

Violations:
Site ID: 384130
Site Name: ABI Foundry
Violation Date: 03-23-2016
Citation: 22 CCR 12 66262.40(c) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.40(c)
Violation Description: Failure to determine if the waste generated is a hazardous waste and to maintain analysis results for three years.
Violation Notes: Returned to compliance on 02/14/2017. OBSERVATION: Stormwater is exposed to facility processes/storage, collected and treated before discharge. Contact water from process (hot dip water spray, pipe slurr) is collected in contact water sump, treated and re-used in the process. Foundry generates slag which is disposed as solid waste. CORRECTIVE ACTION: Submit waste analysis for the collected stormwater and contact water before treatment, and the foundry slag waste for hazardous waste determination to CUPA within 30 days.

Citation:	22 CCR 15 66265.16 - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.16
Violation Description:	Failure to provide employees with hazardous waste training program of class room instructions or on-the-job training within the first six

AMERICAN BRASS & IRON FOUNDRY (Continued) **S101624519**

months after the date of their employment or assignment to a facility, or to a new position at a facility and annually thereafter. Training records on current personnel shall be kept until closure of the facility and for former employees the record shall be kept for at least three years from the date the employee last worked at the facility. The records shall include the following: the job title for each position at the facility related to hazardous waste management, and the name of the employee filling each job; a written job description for each position, duties of facility personnel assigned to each position, and a written description of the type and amount of both introductory and continuing training that will be given to each person filling a position.

Violation Notes: Returned to compliance on 08/09/2019. As demonstrated by the hazardous waste violations observed at the time of inspection, proper training documentation requirements has not been maintained. The records shall include the following: the job title for each position at the facility related to hazardous waste management, and the name of the employee filling each job; a written job description, duties of facility personnel assigned to each position and a written description of the type and amount of both introductory and continuing training that will be given to each person filing a position. Generator has training documentation, but it is missing the job titles, job description for each position, duties of facility personnel assigned to each position, and a written description of the type and amount of both introductory and continuing training that will be given to each person filing a position. Document training according to the requirements of 22 CCR 15 66265.16(d). Submit a copy of the documentation to the CUPA.

Hazardous Waste Summary:

Waste Code:	D001
Waste Description:	IGNITABLE WASTE
Waste Code:	D004
Waste Description:	ARSENIC
Waste Code:	D006
Waste Description:	CADMIUM
Waste Code:	D007
Waste Description:	CHROMIUM
Waste Code:	D008
Waste Description:	LEAD
Waste Code:	F001
Waste Description:	THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLORETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Waste Code:	F002
Waste Description:	THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2, TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Waste Code:	F003
Waste Description:	THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Waste Code:	F005
Waste Description:	THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL

A B & I (Continued) **1000360817**

KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
